Modulating the FM transmitter this way you get an LF response down to 18 Hz (at which point the associated synthesiser PLL begins to track the modulation), and an HF response which is flat to some 10 kHz.

Proceed thus:
 1. Disconnect FT736 from the mains electricity. (Safety).
 2. Remove top cover only.
 3. TX Unit is the module flat on the left (not the one tucked down the
    side vertically).
 4. R32 is just to the left of the rectangular shielded enclosure. The
    resistor is "on end". Scrape any paint off the free leg.
 5. Your TXaudio lead should be a fine screened cable; connect the inner
    to R32, and the outer braid to the adjacent enclosure.
 6. Route the cable out though any convenient aperture in the case.

 7a. 1200 BAUD G3RUH PSK MODEM: TXAudio of 800 mV pk-pk can be obtained by
     adjusting the components C9= 1uf, R3=47k, R5=infinity (i.e. remove).
     C10 stays at 10nf (0.01uf).

7b. 9600 BAUD FSK MODEM: Adjust TXAudio level with VR1

Notes compiled by G3RUH @ GB7SPV 1990 Mar 16

>
>Has there in fact been an effort to allow certain people to develop code
>for these machines that they could have been lying to me about?

I was invited to be an alpha hardware tester for Kantronics, and strongly
encouraged to port the KA9Q NOS package to the box. I have the code up and
running, albeit with some lingering bugs, and hope to be able to share by
late summer (a lot of business and personal travel planned in the next
couple of months, so not much time to work on things).

Kantronics has, in my opinion, made a 180 degree about-face in their policy
towards experimentation with the DE and their data radios. The manuals are
and will ship with schematics, and some memory map information.

>Now the question is, has Kantronics in the past acted this way? Is the

>future going to consist of them not holding back any technical information?

I wouldn't expect them to "not hold back any technical info", but they are certainly providing more than enough info for anyone who cares to to write code for the DE.

>Sorry, but I cannot imaging doing software development without worrying, or
>at least knowing, the hardware design. This is probably because I do work
>with software at the very lowest level and perhaps most programmers never do.
>If Kantronics has the perception of this, and supplies "technical" data on

>better low level code, then this machine is not the developer's machine I
>need. Running a PC and a TNC in KISS mode would serve this need well if I
>were restricted this way.

Calm, Phil... yes, I believe firmly that Kantronics is offering the kind of documentation you're asking for. If they don't, I certainly won't ever ship any software for the box...

Hi John!

However, note that even with faster chips, 56k is running a Z80-based TNC2
pretty close to the edge. I modified two TNC's as per the instructions, and
got them finally into a state where they'd transmit fine, and each would
receive one frame and then no more. I strongly encourage folks considering
playing with the DSY modems to go with PC plug-in cards like the DRSI PCPA or
one of the cheaper alternatives cropping up, or to talk to N4PCR about the
Grace PackeTen card shown for Dayton and available now...

Mike Curtis, WD6EHR is the US distributor for the ST version.
Send him 2 DS or 3 SS ST disks and a note telling him what you want
and he'll get back to you ASAP (1 week for me).

Mike's address is:
     7921 Wilkinson Ave.
     North Hollywood, CA 91605-2210
     (818)765-2857

The version I got is 900517

Unfortunately a lot of what's happening is passed by word of mouth (or
packet) between the BBS software developers. I haven't seen Hank's
documentation but I have some on the "improved BID response" (SID

letter "R") and I have received information from G1NNA describing his compressed "Packed Send" (SID letter "P"). There is also "Improved SEND" (SID letter "S") which is being still worked on.

Trying to get a consensus among the 30-40 BBS writers on every continent makes things go slowwwwwwww.

Hello All,
I'm just getting into the world of TCP/IP on packet and was wondering where one could pick up the latest revision of Net for the Macintosh. I know uunet.uu.net has v1.0 available via anonymous ftp, but I've heard talk on this newsgroup of later revisions...any help would be useful. Please send replies via email to jfk@moore.seas.upenn.edu and I will post a response if there is interest.

Thanks in advance,
de KB8DPV - James

> continuity between the Discriminator and the Modulator? How are you

Obviously the repeater can't compensate for another's reciever since
there are many different recievers using it. The repeater needs to be
set as you describe to a nominal setting with no pre-comensation. The
user stations need to match their recievers to the repeater and their
modulators can be adjusted to match the repeater reciever.

> planning to do your regeneration? The K9NG does not do full duplex and
> as far as I can tell the G3RUH has problems with doing full duplex
> because of clocks. What I have put together is a G3RUH as a demod.
> and a K9NG as a modulator. I still think that there are problems even

Hurrmm. this is an area of concern. I have't hooked it up yet but I
was planning on looping the clock and data back into the modem. I was
running on the assumption that I could do this although I have to
facts to base this assumption. I have put some thought into it and
the worst case is to add a second G3RUH card. Easy to do and for a
repeater not too prohibitive.

> with this setup. The best thing I have seen is a IF translator.
> There is no distortion introduced (if the passband of the translator
> is wider than the signal) but, you still have the problem of having to
> know the "random station's" IF characteristics to use the
> "pre-compensation" feature.

Not only would the repeater have the problem of matching the random
station's reciever but this would bring the problem to every user of

the repeater having to be matched to every other user. At least with regenerating each user has to tweak their own radios to mathc *only* the repeater.

Not being very experienced in this yet I would like to hear more from people using the G3RUH modem especially in a repeater. I have a feeling that by the time I have a working repeater I will have learned a few things...

I've been trying to monitor some packet traffic, but without much success. A own MacRATT, a PK-232MBX and a TH-225A. What happens is that I can see the DCD light go on and off and see the Mark and Space LED's go back and forth, but only rarely does the contents of the packets get printed. The curious part is that the MHEARD list is constantly being updated as though packets are being received. I'll spare the net the rest of the details. If you have any ideas, send me email.

SAREX update from ARRL

Launch is tentatively scheduled for 0445Z on May 15
(12:45 AM, May 16 EDT), but it is subject to change, naturally.

Unless you have a scheduled QSO (if you don't, it's too late now), you can pretty much forget voice contact with the Shuttle on this mission. You can try for a packet contact, however. Use your normal TNC and 2-meter FM radio.

Here is the expected operating schedule for unattended packet (subject to change as mission requirements dictate).

MET	GMT	EDT
Start End	Start End	Start End
0/22:00 - 1/10:20	05/16 02:45 - 05/16 15:05	05/15 22:50 - 05/16 11:05
1/21:15 - 2/08:35	05/17 02:00 - 05/17 13:20	05/16 22:05 - 05/17 09:20
2/20:00 - 3/07:55	05/18 00:45 - 05/18 12:40	05/17 20:50 - 05/18 08:40
3/19:00 - 4/06:40	05/18 23:45 - 05/19 11:25	05/18 19:50 - 05/19 07:25
4/18:30 - 5/05:45	05/19 23:15 - 05/20 10 30	05/19 19:20 - 05/20 06:30
5/17:20 - 6/05:50	05/20 22:05 - 05/21 10:35	05/20 18:10 - 05/21 06:35
6/17:40 - 7/05:35	05/21 22:25 - 05/22 10:20	05/21 18:40 - 05/22 06:20
7/17:45 - 8/04:45	05/22 22:30 - 05/23 09:30	05/22 18:35 - 05/23 05:30

In this table, the MET is the "mission elapsed time," or elapsed time since launch. For example, 1/21:15 means one day, 22 hours and 15 minutes after launch. The GMT and EDT tables are based on a launch time of May 15 at 0445Z. If the launch time is different, adjust the time/date accordingly.

The following is extracted from an AMSAT handout...

Frequencies

Listed below are the frequencies presently intended to be used by SAREX for both packet and voice. Note, that in no case is "simplex" operation indicated. DO NOT CALL WA4SIR ON THE SAME FREQUENCY WHICH YOU HEAR HIM. This procedure may be a little strange for packet folks, but everything works the same way as it does when 2 or more stations are operating on a single channel.

	Shuttle Transmit Freq.	Accompanying Shuttle Receive Freqs.	Offset Designation
Group 1	145.55 MHz	144.95 MHz	Primary
	"	144.91	Secondary No. 1
	"	144.97	Secondary No. 2
Group 2	145.51	144.91	Primary
	"	144.93	Secondary No. 1
	"	144.99	Secondary No. 2
Group 3	145.59	144.99	Primary
	"	144.95	Secondary No. 1
Group 4	145.55	144.95	Primary
	"	144.70	Secondary No. 1
	"	144.75	Secondary No. 2
	"	144.80	Secondary No. 3
	"	144.85	Secondary No. 4

The primary pair for use for both voice and packet is 145.55/144.95. To facilitate communication with ground stations whose split frequency capability is limited to repeater operation, 600 kHz spacing is used on this and all Primary Offsets. However, if WA4SIR experiences too much QRM on a Primary Offset, he may switch to one of the Secondaries in the group corresponding to his transmit frequency. Group 4 is intended for use over Europe and Africa.

Information Dissemination

Dissemination of Shuttle information to those participating, as well as all interested amateurs will be via a system of key stations, particularly WA3NAN, at Goddard in Greenbelt, MD, W5RRR, at JSC in Houston, and W6VIO at JPL, in Pasadena, CA.

These stations, and others, will operate on HF and VHF 24 hours a day, carrying official NASA supplied voice communication between Mission Control in Houston and the Shuttle crew. This is basically the same service that they has performed on all non-DoD Shuttle fights for the past several years. To further provide information specific SAREX communication opportunities and related information, bulletins originated by amateur volunteers stationed at the Johnson Space Center will be fed via a computer network to these stations and others including W1AW. The Metabeacon may also be used for announcements. It is planned that the frequencies listed below will be used for this service. The selection of which HF frequencies are activated at a particular time will depend on propagation conditions.

Station	Approx. QTH	Nominal Frequencies in MHz (+/- QRM)
WA3NAN	Wash. DC	3.860, 7.185, 14.295, 21.395, 28.650. 147.45 (FM)
W5RRR	Houston	3.850, 7.227, 14.280, 21.350, 28.495, 146.64 (FM)
W6VIO	L.A.	3.840, 21.280, 224.04 (FM)
W6FXN	L.A.	145.46 (FM)

All are SSB using the sideband normally used on the band, except where otherwise indicated.

>The new rules specifically prohibit full duplex, repeater-like service
>across those splits. Sad but true.

I wish people would stop talking about what the "new rules" do differently

from the old rules. The intent of the rewrite was NOT to change what is or is not allowed, but to restructure the existing rules to incorporate informal rulings to make them more easily accessible. It was against the rules to put repeaters outside the repeater subband before the new rules were adopted, and it's against the new rules to do it now.

Be that as it may, I did advocate that definitions of "repeater" and "digipeater" be adopted that reflect the important distinction that digipeaters have to be specifically requested by a transmitting station to retransmit their packets, while plain repeaters do not. This is important because the reason for limiting repeaters to subbands is to avoid unintentional repeating of stations that do not wish to be repeated. If a "repeater" will not retransmit a signal unless the sender specifically requests to be retransmitted, then it should be classified as a "digipeater" and not restricted to the repeater subbands. Unfortunately this was considered a too "radical" proposal by the ARRL and it was not incorporated into their rules rewrite comments.

>them on the backbones. The backbones are where the heavy traffic is anyway,
>and there is little "hardware inertia" involved. You could run some strange
>I'm-not-compatible-with-anything protocol and modem on the backbones and it
>wouldn't really matter.

A friend recently presented a counter argument when I suggested the above scenerio. The argument goes like this:

The backbone traffic is orderly and reasonably predicatable and would probably run just fine at 9600 baud or less. The local level is chaos with stations contending and colliding so they should run as fast as possible in order to allow each node to get his packet on the wire and out of the way quickly.

Recently another message supported this perspective, the author was commenting on his local environment in England where 300 stations running 1200 baud were running into congestion problems.

The more I think about it the more I support the view that the nodes out in the cloud should send the data as quickly as possible - running 56K or better would obligate an upgrade in modems and radios but not the computers since you are not expected to provide and decode 50k x 60 x 60 x 24 characters of packets every day. Hopefully each node is not quite that talkative.

I agree that the high speed modems are needed most by the users. Every other computer network I've seen (especially the Internet) has the high bandwidth links (10 mb/s Ethernets, etc) at the local level, somewhat slower links on the regional level, and the slowest links for the long haul paths.

I suspect that many people advocate putting high speed modems into the backbone links mainly because it's easier (i.e., it requires fewer modems) than giving them to the end users. It's somewhat reminiscent of the old joke about the drunk who was observed searching for something under a streetlight at night. When asked what he was doing, he replied that he had lost a contact lens across the street. When then asked why he wasn't looking for it across the street, he replied that the light was better on *this* side...

Also that the highest speeds attainable so far are in bands that support
point-to-point communication. That's why we're looking at a high speed back-
bone in this area. 1 Mb/sec links are not as doable for local, generic use.

I've been playing around with KA9Q (NOS version) and I noticed that it doesn't
seem to read the same hosts.net file that the older version does. Can anyone

tell me if the new version expects a different file name than hosts.net?

Also, how do I configure NOS to use the ethernet port on a UNIX system and at the same time, not interfere with other processes running TCP/IP?

I understand that NOS is undocumented but if anyone has collected a set of configuration notes/hints, I'd appreciate getting them.

Has anyone got a set of schematics for the first rev of the DRSI PC*PA boards that they could share with me? Mine is about two years old and is (I think) the same as the type 1 board now, except for the layout. The first boards had some of the jumper straps accessable from the top of the card while it was in the machine and were located just to the rear of the LEDs.

I'd like to add the TAPR DCD state mod that I picked up in Dayton to it.

I'd also be willing to listen to any advice from those who have added the DCD mod or a K9NG or G3RUH modem to any of the DRSI cards.

thanks de Dave

There are many repeater pairs allocated in this area, but I know
of a few that have to repeater(s) on them. The person "owning"
the pair has just never gotten around to put one up (going on
a decade or more). Maybe it's inventory time, just like we do
at work to see which nodes are used and which are not, then
we won't have to pay tfor the unused ones :-(.

Packet clusters seem to create a lot of traffic, they would
benefit the most from the offset repeater idea :-).

In response to the routing question...

Set the router to handle your trafiic!.
route add [44]/8 dr0a # sends all packet traffic to drsi (tnc)
route add [129.126]/16 lan # sends all 129.126.*.* to ethernet
route add [129.126,81.51] sl0 # sends this one to slip

If you set the default to ethernet then any thing ont listed
goes there. If you add the route command for a group or
individual addresses the that's where they will go.

Don't forget tot attach harware for each interface:
attach **** drsi dr0a
attach **** com1 sl0
attach **** 3com lan

etc.
Hope this helps, I have an XT which routes packet traffic as
well as slips to my other computers, which in turn route
suff to the lan.

Check out these files on tomcat.gsfc.nasa.gov [128.183.10.100]

The files are in tcp/nos:
nos-info.txt   Mainly info on updates.
nosdoc.txt   An archive of notes from the tcp-group dealing with NOS.

sample.net   W3IWI's doc on how to setup NOS.

Also, Phil is working on a doc for NOS. It sounds like it will be out in a
test mode pretty soon.

... while for the switched phone network, the speed capabilities from the
local loop to the long-haul lines is just the opposite. We have slow
connections between the user and the central office, and the fastest ones
on the inter-office lines.

The optimum economical selection of interconnect bandwidth seems to (obviously)
be related to the traffic patterns and topology. In computer networks, the
local area net carries by far the bulk of the traffic (workstation to
fileserver, for example). Much less data needs to travel between sites.

The phone network has a more even distribution of near/far connections, and
the high-speed interoffice trunks are an efficient arrangement for the
topology.

What is the most appropriate model for ham radio packet? How does the
virtual connection vs. datagram mode affect this? (Please excuse my probable
mis-use of the terminology; I am but a humble, clueless neophyte ;-)

Read the STS-35 press info stuff on Sci.space.shuttle. Why hasn't
anyone knowledgeable talked about SAREX on here yet!?!?!?!

Anyway, primary frequencies will be one-fourty-four.95 uplink
                                and one-fourty-five.55 downlink
(ever discover a key doesn't work during a post?)

From the press release, it appears there will be no windows for
live communication for the continental U.S. in VHF. The robot
will be avaible several times.

As far as whether or not you can hit SAREX, I'm not sure.
Making a beam may be a good idea. DOVE was very easy to pick up
on 2m with an HT and a magmount..hitting SAREX might be more difficult.

> bone in this area. 1 Mb/sec links are not as doable for local, generic use.

It's true that high speeds require point to point hardware if we are to make efficient use of our spectrum and hardware resources while providing access to more than a very small number of users. However the specifics of "how point-point" and how fast is fast are intertangled with user population density, geography, spectrum availability and a variety of social/political/economic issues.

Clearly pure Aloha operation in a major metropolitan area can only support *very* low user throughputs (witness 145.01 near any major population base) but the transition to rip-roaring speeds is a shades-of-gray deal.

In addition, the question of highspeed backbone/moderatespeed user or low speed bacbone/highspeed user depends on how we plan on using this thing. I think that there is little question that it is always going to be easier to make and support systems with highspeeds "close to home" but what is desired depends on one's interperetation of a high speed network. Is the emphasis on *highspeed* or is it on *network*? We are going to have to design for some compromise of the two since we aren't likely to be able to provide two way info at 100 MBps simultaneously among all hams worldwide within our lifetime.

The highspeed emphasis opens the door to fundamentally new applications among local users, truly exciting stuff which can do a great deal to make amateur radio enticing and exciting again. I believe we amateurs have the unique resources and skills to provide a "playground" which could entice a *lot* of new blood into the hobby. If even a portion of today's information-age techies; the CS types who didn't go into amateur radio but pursued computer hobbies instead, were attracted to the hobby I think our future would be brighter. Yes, the face of the hobby will have to change some, but it could continue as a vehicle for technically oriented individual to have a hand in the "state of the art". It could certainly also continue in its strengths as a social environment for that group. Highspeed applications might do wonders to augment those things that are already fun and interesting about the hobby too.

The networking emphasis leans in the direction of offering global communications. The demonstrated value and potential of crossing national and cultural boundaries is also truly exciting. Even if we can support little more than low latency worldwide e-mail and not high speed applications (X windows between continents etc) a worldwide amateur network could be extremely powerful in helping continue the hobby. The potential for some very interesting news group titles exists! But 1 million users all running even 300 baud throughput would demand some pretty fancy backbones.

Our present effort here in northern California is to provide a comprimise.

Current plans are for the 900/1200 MHz "user" radios to be used on half-directional/half omni (gain omni antennas) links. These radios are designed to work at or below 500 kbaud. Although I haven't done rigorous modeling yet, it appears that this all has a reasonably good chance of working given current resources and constraints. Longer term, as the number of users, density of users and information rates increase we will have to go to dedicated pt-pt link hardware. Our first backbone for connecting the user cells is expected to use the same sort of hardware as the users themselves. This suggests an emphasis on high speed to the user over networking, per se.

Because of the need for geographically diverse groups to cooperate in building the network and for the need to use amateur expertise and "connections" in getting backbone radios at existing high level sites, some of the early applications which are written for the network need to be ones which sell it to some "non-digital" people. I would love to see a simple client/server written for NOS which would allow remote base and repeater sysops to monitor and control a few bits and an analog line or two at their high level site. Such an application (providing access to the remote from anywhere the network goes) could generate a lot of good will and support from a very important group of amateurs. Such an application in trade for getting UHF or microwave(non-interfering with existing radios because of their higher frequency nature) backbones at a high level site could be a mutually beneficial arrangement.

As has already been mentioned under this basenote, the "political" and cooperational issues are probably more unknown and more difficult than any of the technical issues.

Higher speed hardware, protocols and applications are coming. I guess the question is "Can we cooperate enough to put them all to use in time?"

After finding out that NOS wanted to see either a domain.txt file or hosts.nos
file, I tried copying my old hosts.net into domain.txt and hosts.nos.
Unfortunately this didn't work. But I also just found an old article that
states domain.txt has to be in a domain nameserver format which I presume is
different from the hosts.net format.

Can anyone tell me what this format is supposed to look like?

I have a PK-232 and had been running the PC-Pakratt software for
over a year on a genuine AT without incident.

I have recently put a 386SX in the shack and find that there is a timing
dependency in the PC-Pakratt software that prevents it from operating.
The software indicates that it is "Unable to establish communications
with Pakratt" and terminates.

When I called the tech support at AEA, they told me that indeed there
was a timing dependency in the PC-Pakratt software and that the
original authors of the code were nowhere to be found. I asked about
a fix and they indicated that they had a new program that was going to
be released during the summer. At that point, owners of PC-Pakratt would

be offered a "deal", I was told.

So it looks like the near term solution is to patch the timing loop to eliminate the problem. To save the time, has anyone on the net hacked/patched PC-Pakratt to eliminate this problem?

>I expect QRM will be real bad, but the equiptment I got is what I'm stuck
>with ... I yam what I yam.

     Well, I don't know how suitable your equipment is for earth-shuttle communcations, but all of the details are written up in this month's (May) issue of _73 Amateur Radio_.
     It says the primary frequencies will be 145.55 down and 144.95 up. The article also says (important): "DO NOT CALL THE SHUTTLE ON THE SAME FREQUENCY ON WHICH YOU HEAR IT."
     STS-35 is scheduled for liftoff on May 9 at 0477 UTC, and should be up for 7 or 8 days.
     I'd suggest:

(1) Buy the May _73_.

(2) Try to grab the AMSAT announcements from packet or 'rec.ham-radio'.

(3) Get an orbit calculation program (if you don't already have one).

(4) Watch packet or 'rec.ham-radio' or 'sci.space' for the STS-35 orbital
    elements.

(5) Go for it!

Here is what my domain.txt looks like:

```
nr0d.ampr.org.          IN   A    44.94.3.12
bbs           IN   CNAME    nr0d.ampr.org.
nr0d          IN   CNAME    nr0d.ampr.org.
#
at386.nr0d.ampr.org.    IN   A    44.94.3.23
at            IN   CNAME    at386.nr0d.ampr.org.
#
n0buu.ampr.org.         IN   A    44.94.2.6
n0buu               IN   CNAME    n0buu.ampr.org.
buu           IN   CNAME    n0buu.ampr.org.
#
```

```
unix.g1xrl.ampr.org.    IN   A    44.94.3.15
unix          IN   CNAME    unix.g1xrl.ampr.org.
grettir            IN   CNAME    unix.g1xrl.ampr.org.
#
# This is a comment line.  You can take these out if you want.
#
```

The IN A records define the IP address for the given station. The CNAME records are like an alias. For instance, to ftp to N0BUU, I can enter either of the following:

```
ftp n0buu.ampr.org
ftp n0buu
ftp buu
```

Note that the only reason 'ftp n0buu' will work is because of the CNAME record that ties n0buu to n0buu.ampr.org .
The lines that start with a # sign are comment lines.
Also be sure to use periods after the domain name, like they are above.

Have fun,

Jeff

You can subscribe or unsubscribe to any of the various campus mailing lists and the local redistributions of global mailing lists by sending email to "listserv@ucsd". The commands understood by the listserv program are:

HELP
     lists this file. This is also sent whenever a message to listserv is received from which no valid command could be parsed.

HELP groupname
     lists a brief description of the group requested.

INDEX
     lists all the groups available for subscription.

LONGINDEX
     lists all the groups and their descriptions.

ADD listname
DELETE listname

ADD address listname
DELETE address listname
     adds or deletes the given address to or from the list
     specified. Mail is sent to the address given to confirm
     the add or delete operation. We strongly recommend that
     you use your campus registered mailname when subscribing
     (i.e., use the second form of the command which includes
     a specification of the address). If you omit the 'address'
     the command will assume the mailbox that is in the From:
     line of the message. Note that SUBSCRIBE is a synonym for
     ADD; UNSUBSCRIBE for DELETE.

A command must be the first word on each line in the message. Lines
which do not start with a command word are ignored. If no commands were
found in the entire message, this help file will be returned to the
user. A single message may contain multiple commands; a separate
response will be sent for each.

Please note that is IS possible to add or delete someone else's
subscription to a mailing list. This facility is provided so that
subscribers may alter their own subscriptions from a new or different
computer account. There is therefore some potential for abuse; we
have chosen to limit this by mailing a confirmation notification
of any addition or deletion to the address added or deleted including
a copy of the message which requested the operation. At least you
can find out who's doing it to you.

Examples:

     add sunusers

     add ewombat foodlovers

     delete wombat@cyberpunk.ucsd.edu connectionists

     help eggbeaters

Note that although you would mail submissions to a campus mailing list by
addressing mail to e.g., sunusers@ucsd.edu, in a subscription request
you specify the name of the list simply (without the @ucsd part) as in
the first example above.

Don't know about downloading, but I ordered one from TAPR at Dayton.
It arrived today, but my TNC2 clone (an MFJ-1274) doesn't seem to like it.
When I power up, the STA and CON Leds stay lit, and nothing comes over the
serial port.

Things work as expected when I revert to my MFJ firmware. (TAPR 1.1.3-based,
but with a 1986 Systek copyright). There was a note about bbRAM being loaded
with defaults after trying the new firmware. [does this mean that the new
firmware touched something in bbRAM, but left the LEDs on?]

Any hints appreciated. Mechanical contact between the EPROM and socket seems
OK, but I don't have away to verify the EPROM contents.
THanks.

Hi,
 I just found an old VADCG TNC board (unbuilt) and I was wondering
if it would be worth the hassel of stuffing it and trying to use it.
Can I use a 201 style modem? with it. Is there any software updates

for KISS or normal (modern TNC) modes? Any information would be
would help the cause!

* STS-35 NEWS *
===============
        Highlighting mission STS-35, the 36th flight of the
Space Shuttle and 10th mission of orbiter Columbia, will
be around-the-clock observations by the seven-member crew
using the ultraviolet astronomy observatory (Astro) and
the Broad Band X-Ray Telescope (BBXRT). Both instruments
are located in Columbia's payload bay and will be
operated during 12-hour shifts by the crew.

        Liftoff of the 10th flight of Columbia is scheduled
for 12:45 a.m. EDT on May 17 from launch pad 39-A at the
Kennedy Space Center, Fla. Columbia will be placed into
a 218 statute (190 nautical) mile circular orbit,
inclined 28.5 degrees to the equator. Nominal mission
duration is expected to be 8 days 19 hours 55 minutes.
Deorbit is planned on orbit 139, with landing scheduled
for 8:40 p.m. EDT on May 25 at Edwards Air Force Base,
Calif.

Columbia's middeck will carry the Shuttle Amateur Radio Experiment (SAREX) to communicate with amateur radio stations within line-of-sight of the orbiter in voice mode or data mode. This experiment has previously flown on STS-9 and STS-51F. Also on this mission, Columbia will function as the subject for ground sensor operations as part of the Air Force Maui Optical Site (AMOS) calibration test.

Commander of the seven-member crew is Vance Brand. Pilot is Guy Gardner. STS-35 is Brand's fourth trip to space. He previously flew on the Apollo-Soyuz Test Project mission in 1975. He also commanded Shuttle missions STS-5 in November 1982 and STS-41B in February 1984. Gardner previously piloted STS-27 in December 1988.

Mission Specialists are Mike Lounge, Jeffrey Hoffman and Robert Parker. Lounge previously flew on STS-51I in August 1985 and STS-26 in September 1988. Hoffman flew as a Mission Specialist on STS-51D in April 1985. Parker's previous spaceflight experience was STS-9 in November 1983.

Payload Specialists Ronald Parise and Samuel Durrance round out the STS-35 crew. Both are making their first space flights.

* STS-35 QUICK LOOK *
==========

Launch Date:	May 17, 1990
Launch Window:	12:45 a.m. - 3:09 a.m. EDT
Launch Site:	Kennedy Space Center, Fla. Launch Complex 39-A
Orbiter:	Columbia (OV-102)
Altitude:	218 statute miles (190 nm)
Inclination:	28.45
Duration:	8 days, 19 hours, 55 minutes
Landing Date/Time:	May 25, 1990, 8:40 p.m. EDT

Primary Landing Site:
Edwards Air Force Base, Calif.

Abort Landing Sites:
Return to Launch Site -- Kennedy Space Center, Fla.
Trans-Atlantic Abort -- Banjul, The Gambia
Abort Once Around -- Edwards AFB, Calif.

Crew:

Vance D. Brand	-- Commander	Red/Blue Team
Guy S. Gardner	-- Pilot	-- Red Team
Jeffrey A. Hoffman	-- Mission Specialist 1/EV	-- Blue Team
John M. "Mike" Lounge	-- Mission Specialist 2/EV2	-- Blue Team
Robert A.R. Parker	-- Mission Specialist 3	-- Red Team
Samuel T. Durrance	-- Payload Specialist 1	-- Blue Team
Ronald A. Parise	-- Payload Specialist 2	-- Red Team

Red Team shift is approximately 10:30 p.m. -- 10:30 a.m. EDT
Blue Team shift is approximately 10:30 a.m. -- 10:30 p.m. EDT

Cargo Bay Payloads:
Ultraviolet Astronomy Telescope (Astro)
Broad Band X-Ray Telescope (BBXRT)

Middeck Payloads:
Air Force Maui Optical Site (AMOS)
Shuttle Amateur Radio Experiment (SAREX)

SHUTTLE AMATEUR RADIO EXPERIMENT (SAREX)

Conducting shortwave radio transmissions between ground-based amateur radio operators and a Shuttle-based amateur radio operator is the basis for the Shuttle Amateur Radio Experiment (SAREX).

SAREX communicates with amateur stations in line-of-sight of the orbiter in one of four transmission modes: voice, slow scan television (SSTV), data or (uplink only) fast scan television (FSTV).

The voice mode is operated in the attended mode while SSTV, data or FSTV can be operated in either attended or unattended modes.

During the mission, SAREX will be operated by Payload Specialist Ron Parise, a licensed operator (WA4SIR), during periods when he is not scheduled for orbiter or other payload activities. At least four transmissions will be made to test each transmission mode.

Ronald A. Parise, 38, also will serve as a Payload Specialist. Parise is a senior scientist in the Space Observatories Department, Computer Science Corporation in Silver Spring, Md. He is a member of the research team for the Ultraviolet Imaging Telescope, one of the instruments scheduled for flight as part of the Astro payload. He is from Warren, Ohio.

Parise has participated in flight hardware development, electronic system design and mission

planning activities for the Ultraviolet Imaging Telescope project. He is pursuing his astronomical research interests with the International Ultraviolet Explorer satellite under a NASA grant.

He received a bachelor of science degree in physics, with minors in mathematics, astronomy and geology from Youngstown State University, Ohio, and a master of science degree and a doctor of philosophy degree in astronomy from the University of Florida.

The primary pair of frequencies intended for use during the mission is 145.55 MHz as the downlink from Columbia, with 144.95 MHz as the uplink. A spacing of 600 KHz was deliberately chosen for this primary pair to accommodate those whose split frequency capability is limited to the customary repeater offset.

SAREX crew-tended operating times will be dictated by the time of launch. As a secondary payload, SAREX will be operated by Parise during his pre- and post-sleep activities each day. This means that wherever the Shuttle is above Earth during those operating windows, amateur stations can communicate with Columbia. Currently, those windows provide coverage for Australia, Japan, South America and South Africa.

The continental United States has little or no coverage except through a network of ground stations in other parts of the world in conjunction with relay links back to the United States.

Another part of the SAREX is the "robot," providing an automated operation which can proceed with little human intervention. The robot will generally be activated during one of the crew-tended windows and deactivated during the next one. This gives approximately 12 hours on and 12 hours off for the robot, with the operational period chosen to cover all of the U.S. passes.

SAREX has previously flown on missions STS-9 and STS-51F in different configurations, including the following hardware: a low-power hand-held FM transceiver, a spare battery set, an interface (I/F) module, a headset assembly, an equipment assembly cabinet, a television camera and monitor, a payload general support computer (PGSC) and an antenna which will be mounted in a forward flight window with a fast scan television (FSTV) module added to the assembly.

Antenna location does not affect communications and therefore does not require a specific orbiter attitude for operations. The equipment is stowed in one middeck

locker.

SAREX is a joint effort of NASA and the American Radio Relay League (ARRL)/Amateur Radio Satellite Corporation (AMSAT).

STS-35 COLUMBIA SAREX FREQUENCIES

	Shuttle Transmit Frequency	Accompanying Shuttle Receive Frequencies
Group 1	145.55 MHz	144.95 MHz
	145.55	144.91
	145.55	144.97
Group 2	145.51	144.91
	145.51	144.93
	145.51	144.99
Group 3	145.59	144.99
	145.59	144.95
Group 4	145.55	144.95
	145.55	144.70
	145.55	144.75
	145.55	144.80
	145.55	144.85

Note: The 145.55/144.95 combination is in both Groups 1 and 4 because alternate uplink frequencies from Group 1 would be used over North and South America while those from Group 4 would be used generally in other parts of the world.

Well, now that I've finally been clued into the major differences between the old and new version of KA9Q, I have some more questions (thought you got rid of me huh? :-)).

Can NOS be setup to auto-answer a regular modem (on a standard serial port, not a SLIP line) and connect the caller directly to the mailbox and if so how do I 'attach' the port?

Could someone (somegroup) summarize the pro and cons of setting up a TCP/IP network versus a ROSE network? I understand that setting up a ROSE node entails some changes to a TNC (much like adding a KISS EPROM to an older TNC I suppose). What exactly are these mods? Does a ROSE node require a dedicated computer the way NOS does? Which network has the largest set of users and why? (If you think I'm an ignorant neophyte at this game, you're absolutely right.)

I hacked NOS to accept commands for the modem on a slip link. Making the mailbox forget IP might be difficult (maybe a nightmare), but it could probably be done. BUT, the reason I am posting this is - dont forget about TCP/IP, and have other people call your station when they are running NOS as a term program. I experimented with this, and the nice thing is that you can have multiple sessions. At 2400 baud, I had someone transfer two files to me, I was transferring two files to them, and we had a chat session going all at the same time ! Someone could start an ftp session with you to grab a file, and while it was transferring they could telnet to your mailbox to read mail, etc. It beats the hell out of xmodem or some other protocol.

DAEDALEAN's packet test for US Navy

Date:
May 7, 1990

     GOOD NEWS !

     The US Navy has decided to go ahead with a demonstration

test to measure the effectiveness of data transmissions from ship to shore. The following mediums shall be utilized:

- L-Band 1545 Mhz INMARSAT satellite
- HF 20 - 30 Mhz links with data modems
- Navy owned Fleet SATCOM satellites (2400 bits/second)

This represents a significant step forward for the US Navy, to measure the cost/benefit of moving data from ship to shore directly from PC user to PC user. Data will not be routed through traditional channels, i.e. radio room, communications officer.

Test shall be conducted by the Navy Electronic Systems Activity at Vallejo, Ca. Test area shall be an aircraft carrier sailing out of San Diego, CA.

If you would like more details let me know.

ROSE *is* on a PROM.

>Does a ROSE node require a dedicated
>computer the way NOS does?

One person's "require" is another person's "take advantage of". :-)

I was flabbergasted when ROSE first came out to discover that it
doesn't let you use the full power of your personal computer; it's
just another ROM replacement. I guess that's good news for people who
don't want to run their PCs on packet, but bad news for those of us
who are enjoying the new-generation software (like the KA9Q package)
that lets our desktop computers do what they're built to do instead
of sitting around like dumb terminals (or even smart terminals).

BTW, net experts, does ROSE also support AX.25 and NET/ROM the way the
KA9Q package does? Maybe it does; I just don't recall.

Patty

At the Dayton Hamvention I saw (very briefly) a description by G3RUH of his
modifications to a Yaesu FT736R for his 9600 baud modem. I'd like to obtain
a copy, preferably ascii, of this information. Would anyone having a copy
please post it to this group, or email it to my address listed below?
Both Lafayette-area FT736 and G3RUH modem owners thank you in advance!

I was discussing some upgrades to the local repeater group's net/rom
node configurartion with them and ran into some interesting rumours.
It seems that there are reports of performance problems with net/rom in
the configurations they're planning on using here. I couldn't confirm
or deny these rumours. Anyone who know more? (These are for real
Raikes net/roms plugged into TNC2s with the fast processor clock
selected.)

Rumour 1. Net/rom can't achieve a long-term throughput sufficient to
justify using 9600 bps radios; supposedly the software spends so much
time with interrupts disable or doing malloc/frees or something that it
just can't get more than an effective 4800 bps through it.

Rumour 2. Net/rom doesn't have very good throughput in a three-station
node because there is some problem with the RTS/CTS arbitration of the
serial lines coupling the TNCs together; apparently collisions or long
holdoffs or something occurs on the serial interconnections that limits
effective throughput.

I don't have the facilities to experiment with this to confirm or
dispute these rumoured problems. Anyone know for sure? A solid answer
would really help me advise the local group.

Does anyone know when AEA will begin shipping the PS-186?
Do I remember correctly that it has more ports and more other
capabilities than the Kantronics Data Engine?
What needs to be done to convince AEA to nake this product available
to us?

SAREX-II is a secondary payload on STS-35, currently scheduled for launch on
May 17, 1990. It will be located in the Aft Flight Deck of the Space Shuttle
Columbia. Ron Parise, WA4SIR, the Payload Specialist and astronomer on Colum-
bia will be the Astronaut ham operator.

SAREX-II-02 is a secondary payload on STS-37, currently scheduled for launch
on November 1, 1990. It will be located in the Aft Flight Deck of the Space

Shuttle Atlantis. Ken Cameron, KB5AWP, the pilot of Atlantis will be the Astronaut ham operator.

The American Radio Relay League (ARRL) is the customer on the SAREX-II payloads. NASA gave its authorization for SAREX operations for the following reasons:

> To encourage our youth to become excited about science and technology, and
>
> To familiarize large numbers of the general public with manned space flight

NASA's intent in making astronauts available for SAREX operations is to involve the largest possible number of people, particularly youngsters, in Amateur Radio and the US space program. With amateur radio clubs and hams, our astronauts will speak over amateur frequencies directly with large groups of students, showing teachers, parents and communities how Amateur Radio energizes youngsters about science, technology, and learning.

You can easily become a part of this activity in your local school, as the astronauts will operate the SAREX equipment in the amateur two meter band. You will be able to send and receive messages via packet for periods of about 12 hours daily. The astronauts' work schedules will determine your chances for a voice or television message, but Ron and Ken may have an hour or more each day for these modes.

The Johnson Space Center's Amateur Radio Club station, W5RRR, in Houston, Texas, will re-transmit astronaut's signals to WA3NAN, at Goddard Space Flight Center, in Greenbelt, MD (near Washington, DC), and to W6VIO, at the Jet Propulsion Laboratory in Pasadena, CA. These stations, plus W1AW and several VHF and UHF repeater groups, will re-transmit the signals on most amateur bands so that you and the students can copy the communications. You will hear NASA Mission Commentary, frequent bulletins to advise listeners of astronaut planned transmissions, and all amateur two-way voice and amateur television transmissions with the shuttles. Using a simple hand-held transceiver, you can open the world of science to hundreds of youngsters. Students themselves can take part in the shuttle flight via a packet connection, and some will even be able to talk directly to the astronauts in orbit.

ARRL and AMSAT are co-sponsoring these exciting missions, with AMSAT heading up technical operations. Hundreds of Amateur Radio operators have already been working behind the scenes for months. The ARRL takes the lead with information and educational support. ARRL Educational Activities Branch (EAB) and NASA HQ will create lesson plans for teachers. All you need to provide is a 2-meter rig or a packet radio setup. If you are a teacher or instructor, contact ARRL EAB to get everything you will need and regular news updates. If you are a parent or a grandparent, contact ARRL EAB and a local school. EAB will send you materials, including ways to convince teachers and school administrators that Amateur Radio is an important discipline the school should take advantage of on a full-time basis.

This a tremendous opportunity for you to showcase SAREX 1990 and amateur radio to kids of all ages in a big way. Plan on being a part of it; contact ARRL EAB now and give your best to our exciting hobby and to our hope for tomorrow: America's youth.

Listen to the ARRL Bulletins on W1AW (see QST for CW and voice bulletins) on a daily basis; and to the AMSAT Nets on Tuesdays (U. S.), 3.840 MHz, 01:30Z to 03:00Z, and on Sundays (international), 14.282 MHz, 18:00Z to 21:00Z, +/- QRM.

[ANS would like to thank ARRL and NASA for this contribution. Stay tuned next week to the ANS bulletins for more details about the STS-35 mission and its amateur radio operations.]

The WA4SIR flight aboard the STS-35 flight of the Shuttle Columbia is still officially scheduled for early May 16th (GMT), although there are some hints that it might slip by one day. The SAREX mission will carry the packet ROBOT automatic QSO machine which will allow many amateurs around the world to have two-way packet QSO's with the Shuttle during the times when our ham astronaut, Ron Parise is busy.

To work the ROBOT, you transmit on 144.950 MHz and listen to the Shuttle on 145.550 MHz. Subsequent SAREX information bulletins will give you operating hints and describe the schedule in more detail.

If you are successful in making a two-way QSO, you call and your unique QSO serial number will be automatically logged and you will receive a QSL card after the mission. You will know you met all requirements of a two-way QSO by seeing your call in the QSL beacon which will be sent every 2 minutes and looks something like:

```
WA4SIR>QSL <UI>:
NI3F/186 WB2TNL/185 W3IUI/179 WB3AFL/177 NF3N/176 WA3EPT/175
N4QQ/174 W3IWI/172 JY1/153 U6MIR/127
```

If you are heard by the ROBOT, your call will appear in the QRZ beacon which will look something like:

```
WA4SIR>QRZ <UI>:
#3405-NE3H NI3F K1LNJ WB2TNL WB3ILO N3ACL N3FWX WA3TSD WA3USG
etcetera
```

where the #3405 is a serial number incremented every 2 minutes when the QRZ beacon is sent.

Unlike the QSL "worked" list, the QRZ "heard" list is not retained in the ROBOT and the laptop computer on the shuttle. In order to send SWL cards to those who were heard, it will be necessary to have amateurs around the world help to collect the list. When you are monitoring the WA4SIR SAREX transmissions, try to capture the beacons and send them in to us in machine readable format. We are only interested in the QRZ and QSL beacon information; please strip out everything else (like QSOs monitored, any other beacons, etc.). You may send it through the amateur packet network addressed like this:

SP SAREX @ W3IWI.MD.USA

or via the Internet addressed like:

sarex@tomcat.gsfc.nasa.gov

and make the Subject: field contain the date/time of the beacons like:

May 19 @ 03:42z

Here are several hints that may help you make a successful packet QSO with the SAREX ROBOT that will fly with Ron Parise, WA4SIR in mid-May.

1. Frequencies: Your transmitter uplink frequency should be 144.950 MHz and you should listen for the shuttle downlink 600 kHz higher on 145.550 MHz. Under no conditions should you transmit on the 145.550 downlink!

Since there may be other packet or voice activity in your area on these frequencies, local coordination to insure a clear frequency during the ten day STS-35 mission may be needed.

2. Modulation: The uplinks and downlinks are ordinary AFSK/FM 1200 BPS signals, just like most terrestrial VHF packets. No special modems are needed. You are advised to check your transmitter's FM deviation and set it to 3 kHz or less. Most radios are typically set to 5-6 kHz and this will be too wide because of doppler shifts. If you don't have a deviation meter, listen on another radio and crank the tone level down until you hear the volume drop noticeably. Most people run too much deviation on their packet signals anyway, and you will probably find this improves the reliability on terrestrial paths too!

3. When to hear/work the shuttle: During the mission Keplerian elements and predictions will be sent frequently by WA3NAN, W5RRR, W6VIO, and many local FM repeaters, as well as by packet bulletins addressed to @AMSAT. Check with your local AMSAT area coordinators for information in your area. In general in the USA, the windows are in the late evening and early morning hours. Don't expect the SAREX hardware to be activated until the second day of the ten-day mission. Because the inclination of the shuttle orbit is only 28.5 degrees, the signals can only be heard between about +43 and -43 degrees latitude.

4. LISTEN!!!: Most packeteers don't listen to the BRAAAAP! from their radios, but you should listen during the shuttle activity. If Ron is personally available, he may turn off the SAREX packet hardware and be QRV on voice.

5. Connecting to the shuttle: All you do is to issue a connect. If you are heard, you will see something like this:

```
cmd: CONNECT WA4SIR
*** Connected to WA4SIR
```

```
   #191--- Tnx QSO with the SAREX Shuttle "ROBOT" automatic QSO machine
   *** DISCONNECTED
```

When the ROBOT hears your "ack" of its transmission, it will disconnect and you will be in the log. Because the ROBOT queues information for 3 seconds and sends several replies in one transmission, you should set your DWAIT to about 4 seconds.

6. Multiple QSO's: Once you have worked the ROBOT and make it into the log, no further QSO's from you will be logged (even if you use a different SSID). Give others a chance and don't connect multiple times!

7. Monitor!!!: Every 2 minutes a beacon addressed to QRZ will list stations heard recently, and the QSL beacon will list those worked. Every 3 minutes the Metabeacon (up to 1.7 kbytes in 7 packet frames) addressed to QST will send text describing shuttle activities. Monitor these beacons to keep informed. In Bulletin #1 we ask for you to submit copies of the QRZ and QSL beacons you copy.

8: Your chances for success: Signals from many hundreds of stations can be heard from the shuttle. With FM transmissions, only the strongest signal "wins", just like in a DX pileup. To help, the ROBOT can have up to 9 QSO's in progress at any one time. Perserverance and a well equipped station will help -- but if activity levels are high and the uplink channels are busy, it will be a matter of luck.

I would like to know a little more about how the present BBS's using AX.25 do mail and posting forwarding. I am interested in basically enough of the protocol to actually design a BBS program that does it just the same, though I doubt if I ever will (SMTP/TCP/IP is the way I would anyway). Pointers to magazine articles, books, etc, would be useful. I mostly just want to understand the concepts so I can comprehend things like failure modes, but this does require bottom level protocol knowledge equal to BBS writing.

Actually, Kevin Rowett N6RCE postulated a different reason that I thought made a lot of sense, and which has caused me to moderate my opinion on this subject.

He suggested that bandwidth tends to follow lines of "social locality". In the normal engineering environment, your social neighbors, or co-workers, are typically near you physically, leading to lots of local bandwidth. Your interactions with folks who are physically far away are much less, such that the need for bandwidth falls off with physical distance.

He pointed out that as Hams, may of us belong to "social groups" that are not physically adjacent. The fact that the 10Ghz work N6GN started is being carried on by folks in CO and Ottawa is an example of a social, or work, group that wants desperately to share a "fast lan", but which is widely separated physically.

The concept of bandwidth "local to the users who communicate with each other" is still valid, it just doesn't map with geography.

>I have not yet seen a list of the new packet related equipment
>that was introduced at Dayton last weekend. Can anyone who was
>there or has heard a report on this supply us with this info?

The only outfit actually selling anything new this year at Dayton
was Grace Communications, consisting of N4PCR and friends and
their 68302-based packet switches.

AEA was showing the N4HY-designed DSP-based "pk232-replacement",
a standalone TNC with modems implemented using a Mot 56001 DSP
chip... neat stuff. Dunno when it'll ship. They were once
again distributing a PS-186 flyer, but no board in evidence,
they seem to be waiting for me to "finish *the* software"
(emphasis mine), dunno if/when it'll ship.

TAPR had a set of loaded boards for the packetRADIO to show, and
schematics of the approaching-alpha-test TAPR DSP PC plug-in
card. Dunno when it'll ship.

Kantronics was showing a neat new box that implements a weather
monitor that can be hooked to a TNC or computer, and connected
to remotely. Didn't have much time to play with it. They were
also showing their Data Engine product, which is a dual-port
V40-based TNC. It just passed FCC testing, dunno when it'll ship.

I didn't see much new at the DRSI booth, we're still hearing
about the 56001-based DSP card they're working on with DSSI,
but dunno when it'll ship. (starting to sound like a broken
record, right?)

I didn't ever get very close to the Paccomm booth because of the
crowd surrounding them and AEA (across the aisle from each
other!), but I heard they have a TNC with modified firmware to
implement a 1200 baud full duplex regenerating repeater in
software... sounds neat.

The GRAPES guys were in the flea as usual, with WA4DSY modems
for sale... dunno how well they fared.

Since I now have gotten a 386 unix box i'll like to use it for packet but

     which card should i use (what would you recomend)
and
     is there a UNIX driver for it
and
     is there any UNIX commands
and
     does anybody know if the AX25 protocol is aveileble electronicaly
     some where or do i have to order a paper copy.

I could proberly write the driver and commands my self (beeing a sw guy)
but that will take time and i would proberly reinvent the wheel.

I goofed and posted a message titled "Packet and FT-207r" on the
rec.ham-radio board instead of rec.ham-radio.packet.   Could anyone
read it anyway and possibly help? I'm trying to get started with
packet.

It requires a file called DOMAIN.TXT which also happens to be a
different format than HOSTS.NET. Here is a sample entry from DOMAIN.TXT:

```
## Bob  Springfield
nq1c.ampr.org.  IN      A       44.44.0.35
nq1c.   IN      CNAME   nq1c.ampr.org.

I also had a problem as you described above.

What I did to resolve it was to turn down the volume, disconnect the audio-in
or set the DCD Threshold to a point where the CD light doesn't come on.

Then reinitialize the I/O.

Works every time for me. PK-232/MBX with PC-Pakratt.

I suspect that having active data transitions while it's trying to initialize
just blows their firmware's mind..

hope this helps
later

>Does anyone know when AEA will begin shipping the PS-186?

No. At Dayton, AEA once again had a spec-sheet available, but was not offering any price or delivery information that I heard.

I understand that they passed FCC, and claim they are "waiting for software" before beginning production and shipments.

>Do I remember correctly that it has more ports and more other
>capabilities than the Kantronics Data Engine?

It has 4 ports plus console instead of 2 plus console, or 5 instead of 3 if you're thinking in switch terms. It has provision for an optional SCSI interface. It uses an 80C186 instead of a V40, which is a bit of a downer, but simply indicates vintage, and doesn't affect performance notably.

>What needs to be done to convince AEA to nake this product available
>to us?

Dunno. Every time I've heard from them, it's been a different reason. At Dayton, they made it pretty clear they expect me to deliver up a NOS implemenation before they'll ship.

It's absolutely amazing to me that AEA has invested in the PS-186, and would halt that close to production out of an unwillingness to invest in any internal software development. The Kantronics approach of shipping software that makes their unit look like a multi-port fast TNC by default is really neat, because it means they can ship hardware that can be semi-useful to people even without any additional software effort. And it's a fundamental law of nature that folks like me write software for whatever hardware *is available* that solves a given problem.

If you want a PS-186, call AEA and tell them so, and try to pin them down on price and delivery information. Make it clear to them that you want hardware sooner rather than later, and if you feel strongly enough about it, tell them you want it regardless of software availability.

If you want a DE with more ports, call Kantronics and ask them if/when they might do a 4-port follow-on product.

If you want a 5-10 port switch product you can buy today, that's very fast with a price to match, contact Grace Communications and ask about their PacketTen, which was shown and was available for sale at Dayton, based on a 68302 processor. They'll answer email at uunet!ldhmi!donl, I'm pretty sure. They had NOS running on the board at Dayton... pretty neat.

Either way, I've got NOS "almost working" on both the PS-186 and the DE, and sometime this summer you'll be able to get ROMs from me somehow (maybe via TAPR?) that give you switch functionality on either the PS-186 or DE.

>
>What is the most appropriate model for ham radio packet?

[The original article wondered about relative speeds between switches]

In general, Internet practices deliver service such that the more interaction
had with someone (or his data), the faster the link provided. Locality of
data access forms the link arch.

We all have very fast (10 Mbps - 100 Mbps) to our file servers and to people
in our work group. To other employees within the same company, it ranges from
T1 to 10 MBps. TO Mr. Karn, it drops to a nailed up 9.6Kbps V.32 SLIP link.

So, physical adjacent maps to speed adjacency. For the AR community, speed
adjacency and physical adjacency don't map too well.

For Internet practices, the pipe gets smaller the farther data travels.
TELCOs, on the other hand, always delivery the same size pipe, no matter
how far you travel. Bear in mind, the pipe the TELCO delivers is universally
too SMALL.

Just ideas for thought.

A conversation on the local repeater this afternoon brought up an issue
that was news to me. A ham who works in the land-mobile business commented
that the FCC is going to reallocate most of our 900 mhz band in several
large metro areas - Atlanta included - to land-mobile service. He
further commented that there was a NPRM published a couple of months
ago.

I never saw anything in this group, from the ARRL, or anywhere else
about this turn of events. Anyone else know anything about this state
of affairs?

We have lost the 904 - 912MHz portion of the band to an arm of Pacific
Telephone. In fact, later this month the Southern California frequency
coordination board for 900 will be meeting in a special session to
rearrange the bandplan; there is also the possibility that a second chunk,
from 916 - 924MHz, may be on the block.

However, the ARRL is busily pursuing the matter; right after they get
done with their monument to dead hams.

What am I going to do? Seems like it's time to put packet on 900 and
make terrible amounts of noise... (See? Packet IS good for something!)

Yeah, and you cost me a bundle, too! I wandered by Spectrum International on Sunday morning and bought their last 220 transverter, and one each 220 and 430 downconverters... now I have all the pieces to build our repeater, if and when I can find time...

:-)

Anyone know where the latest releases of both the Macintosh & Commodore-Amiga
version of KA9Q can be FTP'd from? The Macintosh KA9Q I have is very buggy.
And a friend of mind with a Commodore-Amiga wants to run KA9Q.

One of the amusing/annoying things about bulletins is watching a station transmit a bulletin that is obviously way out of date. As an example, consider the bandwidth that has been wasted due to the continued transmission of a bulletin announcing the launch of the MICROSATS. This bulletin was still being transmitted long after the event and was then closely followed by bulletins that gave more recent element sets, each of which was soon superseded by another. Other examples are the ARRL DX bulletins and the AMSAT satellite element sets whose useful life is typically only two weeks.

The problem here is not the individuals who generate the bulletins, nor is it really the SYSOPs fault. What is required is a mechanism, built into the bulletin transmission, which automatically prevents an out of date bulletin from being forwarded (even if it has not been forwarded to all stations on a BBS forwarding list) and which also deletes bulletins once their usefulness has expired.

In Europe there's a BBS called THEBOX which has an extra field when sending a bulletin called the 'lifetime' field. At the end of the line there's a field that looks like this '#12'. The # indicates a lifetime field and the 12 says the bulletin's lifetime is 12 days. So any BBS that has this bulletin for more than 12 days will stop forwarding it and, presumably, also delete it. However, there are two problems with this. It is not compatible with most BBS systems here in North America and may make some of them croak. But it also does not prevent the continuous transmission of the bulletin after its original lifetime is up. This is because its lifetime is relative to when it was received at a BBS. So if I create a bulletin with a lifetime of two days and just before the two days are up I send it to someone else, then it can live for two more days there. If they then

send it on, it lives another two days and it can therefore live much longer than it should.

I have a proposal for any and all BBS writers out there. I believe this proposal is compatible with all existing systems and will help alleviate the above problem if implemented.

I propose that an expiry date be encoded in the BID field of any bulletin. The advantage to this is that every BBS accepts and passes BIDs. If they don't understand the expiry field, it won't matter because they'll just pass it on and treat it as they would any other BID. But compatible systems would do 'the right thing'. The BBS I'm most familiar with is CBBS (which I ported to the AMIGA) and it's BID field is limited to 12 chars. So to minimize the amount of space taken up in the BID I propose to encode an expiry date in the following way. If the first character of the BID (after the '$' BID indicator) is a number sign '#' (arbitrary, but we must all agree on it) then it is followed by two more characters which encode month and day of expiry. This encoding will assume that bulletins are never permitted to have an expiry date more than six months into the future. As an example, if I created a bulletin with an expiry date of May 5th and it is now May 10th then I consider May 5th to be over 11 months into the future (i.e. it refers to NEXT May 5th). Thus a bulletin has expired if its expiry date specifies a month/day that is more than six months in the future. If necessary, this 'standard' could add another character to include the year as a number relative to 1990 but this would then permit ridiculously long expiry dates. The month (1-12) and day (1-31) are encoded as a single character by indexing the number into the string

0123456789ABCDEFGHIJKLMNOPQRSTUV

Thus an expiry date of Jun 14th would be encoded as #6E and the remainder of the BID then follows e.g.

sb all @ sask <ve5va $#6E2214ve5va

Putting the expiry date first ensures that it won't get truncated by a system which stores a shorter than normal BID. Any current system that doesn't know what the #6E means will simply pass it along as a part of the BID.

BUT, compatible systems are required to do the following.

1. If a system sends you a bulletin whose BID expiry date is more than six months in the future then you must reject it (i.e. the BBS replies 'N - expired'). This will occur if a non-compatible system tries to forward an expired bulletin.

2. No bulletin that has expired will be forwarded any further even if it has not yet been distributed to all those you normally send it

to.

3. In the BBS cleanup process, the SYSOP should have the option to specify that expired bulletins are automatically deleted (or archived), otherwise they are marked as 'O'ld and the SYSOP will still manually clean them up.

4. A modification is required to the commands (SB, MB etc.) that create bulletins. First there should be a universally agreed (or SYSOP specified) default expiry time, such as 14 days from the date of creation which is used on any bulletin created without an explicit expiry date. There should also be a universally agreed maximum that users can specify, say, 3 months? certainly no more than 6! Then, borrowing from THEBOX, the syntax for the SB, and similar, commands should be extended so that the user can specify the lifetime of the bulletin in days (e.g. to 21 days) by adding #21 on the end of the command. This does NOT mean that the #21 is sent when the bulletin is forwarded. It is converted into the encoded expiry date in the BID and the #21 is stripped from the command. This would have the slightly beneficial side-effect that systems with this feature would automatically adapt to receiving such a command from THEBOX and would convert the lifetime into a useful expiry date for further transmission. There are lots of RLI/MBL/MSYS systems in Europe, some of which must talk to THEBOX, and this will make them more compatible. If you implement such a BBS you could make it even more compatible by detecting if you are forwarding to a THEBOX (look for either [THEBOX or [DL5UY), and converting the expiry date back into a # field at the end of the sb command (but, of course, leave the expiry field in the bid). My CBBS currently stores and forwards the lifetime field to THEBOX. (I use the THEBOX syntax only because it already exists and I don't know of any other system that has anything similar).

NOTE that the worst that happens with this system is that things stay as they are - they don't get worse. But if implemented it helps to improve things considerably.

I will probably implement this in the next CBBS distribution for the AMIGA.

Any comment?

It seems that we hams are doing our typical thing again: re-inventing wheels.
Why not use the experience gained by the USENET community in building a very
large distributed bulletin board system, not to mention all of the code that's
freely available? Instead, its being re-invented bit-by-bit, piece by piece.

NIH: gack!

I have a problem with NOS when I am using either ax.25 or net/rom.
The problem is that whenever the sending station sends me more
than one frame, my acknowledgement of the first frame collides with
the second frame sent by the sending station.

This never happens with IP packets, but always happens with ax.25
and net/rom packets. Can anyone give me any hints what parameters to
tinker with to eliminate this problem? Thanks in advance.

SpaceNews

MONDAY MAY 14, 1990

SpaceNews is published and distributed weekly around the world on USENET and Amateur Packet Radio. It is available for unlimited distribution.

* STS-35 NEWS *

The launch of STS-35 has been delayed at least until 31-May-90 due to a Shuttle hardware problem.

Here is the expected operating schedule for unattended SAREX operations by Ron Parise (WA4SIR):

Mission Elapsed Time
(D/HH:MM)

Start	End
0/22:00	1/10:20
1/21:15	2/08:35
2/20:00	3/07:55
3/19:00	4/06:40
4/18:30	5/05:45
5/17:20	6/05:50
6/17:40	7/05:35
7/17:45	8/04:45

Listed below are the frequencies presently intended to be used by SAREX for both packet and voice. Note, that in no case is "simplex" operation indicated. DO NOT CALL WA4SIR ON THE SAME FREQUENCY YOU HEAR HIM!!

	Shuttle Transmit Freq.	Accompanying Shuttle Receive Freqs.	Offset Designation
Group 1	145.55 MHz	144.95 MHz	Primary
	145.55 MHz	144.91 MHz	Secondary No. 1
	145.55 MHz	144.97 MHz	Secondary No. 2
Group 2	145.51 MHz	144.91 MHz	Primary
	145.51 MHz	144.93 MHz	Secondary No. 1
	145.51 MHz	144.99 MHz	Secondary No. 2
Group 3	145.59 MHz	144.99 MHz	Primary
	145.59 MHz	144.95 MHz	Secondary No. 1
Group 4	145.55 MHz	144.95 MHz	Primary
	145.55 MHz	144.70 MHz	Secondary No. 1
	145.55 MHz	144.75 MHz	Secondary No. 2

145.55 MHz	144.80 MHz	Secondary No. 3
145.55 MHz	144.85 MHz	Secondary No. 4

The 145.55/144.95 combination is in both Groups 1 and 4 because alternate uplink frequencies from Group 1 would be used over North and South America while those from Group 4 would generally be used in other parts of the world, such as Europe and Africa.

Dissemination of Shuttle information to those participating in SAREX, as well as all interested amateurs will be via a system of key stations, particularly WA3NAN, at Goddard in Greenbelt, MD, W5RRR, at the Johnson Space Center in Houston, and W6VIO at the Jet Propulsion Lab, in Pasadena, California. These stations, and others, will operate on HF and VHF 24 hours a day carrying official NASA supplied voice communication between Mission Control in Houston and the Shuttle crew. To further provide information specific to SAREX communication opportunities and related information, bulletins originated by amateurs stationed at the Johnson Space Center will be fed via a computer network to these stations and others including W1AW. The SAREX Metabeacon may also be used for announcements. It is planned the frequencies listed below will be used for this service. The selection of frequencies will be made depending on HF propagation conditions during the mission.

Station	Approx. QTH	Nominal Frequencies in MHz (+/- QRM)
WA3NAN	Wash. DC	3.860, 7.185, 14.295, 21.395, 28.650. 147.45 (FM)
W5RRR	Houston	3.850, 7.227, 14.280, 21.350, 28.495, 146.64 (FM)
W6VIO	L.A.	3.840, 21.280, 224.04 (FM)
W6FXN	L.A.	145.46 (FM)

All are SSB using the sideband normally used on the band unless otherwise noted.

Hi,
   I was wondering if anyone on this conference could give me info on who
in the New York city area is running TCP/IP.
   A friend (KA2PBT) and I are just starting out with the KA2Q software
and was wondering :
1) Who in the NYC (Staten Island) area is running KA9Q
   (calls/QTH/net addresses etc)
2) What freq/data rates (5.01/4.95 etc) are most common here?

   Thanks in advance
   Don

The latest released version of the Mac code can be found in /pub/ham-radio on apple.com. Anyone who really wants to stay informed about new releases should send their name and address to Doug Thom, N6OYU, at 1405 Graywood Drive, San Jose, CA 95129. He can provide you with interim (i.e., not official releases) versions.

>The Macintosh KA9Q I have is very buggy.

What version is this? There's been a very stable version available since at least April, 1989.

All you have to do is to get the other stations to set their MAXFRAME parameters to 1. Half duplex AX.25 packet radio stations should always operate this way, with packet sizes varied to suit channel conditions.

While they probably should, remember that not everybody has been ordained in the Holy Church of Karn's Packet Operating Technique, and investigate the problem a little further. Is this collision happening because the other station drops carrier between the two packets? If so, won't the retransmission happen with the carrier on continuously, and the acknowledgement be sent for the last frame - or does the AX25 handler do that? If not, is his TNC trying to transmit while there's still a signal on the channel, or is the link weak enough that his TNC

is losing lock?

The recommendation in the past has been that BBSes and other data hosts
run with a MAXFRAME of 1, but said nothing about user stations.

(On another subject, my system has been down for two weeks. Have you
come up with a politically acceptable spectrum management plan yet?)

The copy of MacNET that I have is from simtel20.arpa which seems to be exactly
the same as the one on flash.bellcore.com. The copy on apple.com has a later
date on it so I'll check into it.

The version I now have running (or not running) rejects the attach
commands in the autoexec.net file, but when the same attach command is typed in
manually in the console window the program takes it (am I missing something
obvious?). There are also a number of inconsistencies between the on-line help
and the separate help doc about the syntax of the attach command.

Some factors to consider:

1) It's unusual for KISS TNCs to sense RF carrier at 1200 bps. They
usually listen for data carrier, and if you're running a squelched FM
radio, they may take far to long to do that. You should have a decent
carrier detect circuit. Of the 1200 bps standalone TNCs on the market,
ONLY the MFJ1278 does, as far as I know. You can add it to all the
rest - mod kits are available from TAPR for $11 to $20 or so. Makes a
BIG improvement in performance.*

2) Even if your TNC does sense carrier well, it can't report it to the
software, so all the collision avoidance is done in the KISS code
inside the TNC and not in NOS.

3) If the TNC is in full duplex, it will transmit even if it's hearing
data carrier.

4) If there are more than two stations (including yourself) active on
a channel, EVERYONE should be running with MAXFRAMES=1. Otherwise a
collision wastes a gross amount of time.

*In some recent tests here, I found that I typically had to have TXD
set around 15 to 30 to reliably send my packets whilst receiving with
an unmodified TNC on a squelched radio. Modifying the rx TNC to
detect data instead of energy as carrier allowed me to leave the
squelch blowing; I could then use TXD on the order of 6 to 8. With
short packets, that can more than double throughput. Not bad for $11
and an hour's work.
     - Brian

I need some help from the interference gurus out there. I am trying to set up a portable packet station using a kenwood th-21at, a heathkit hk-21 tnc and a portfolio. The problem is that the portfolio creates a whining sound right around 145.01 and 223.5 Mhz. I doubt that anyone has specific info on the atari but how about some general idea on supressing computer interference that are applicable to the portfolio. I know that the computer is the culpret through the process of elimination, and the realy nice part it that it only interfers when running a program, especially the term program for it. I am going to try some other programs but it's serial port is not quite standard at the low level so I doubt that they will work, also they (the other programs) are very big. The term program for the portfolio is just over 2k and includes xmodem file transfers and programmable function key strings. Oh well, any help will be appreciated.

I have a educational application for packet radio, where we would like to run some high-speed links using KA9Q tcp/ip package.

While I have done this in my amateur installation (wb7tpy.ampr.org) at 1200 baud, what speed modems are available at the moment in either design or kit form ... 9600? 56kps?

Any information would be appreciated.

David

I have written a document entitled "Beginner's Guide to TCP/IP on the Amateur Packet Radio Network Using the KA9Q Internet Software." This 44 page guide documents the use of NET v890421.1 and BM v3.3.1 on an IBM PC or clone with a serial interface to a TNC running the KISS firmware.

The guide is available by anonymous ftp from clover.ucdavis.edu [128.120.57.1] as the 113K ASCII file "begin.doc" in the directory /pub/ka9q. Comments and suggestions for change to the document are welcome.

I'm sure someone will ask why the guide documents NET now that NOS is available. The main reason is that NET is most commonly in use in my area. When I helped to set up a TCP/IP switch, the users needed a better manual, so I took a shot at writing one. My next project is to attempt to port NOS to my Sys5 (actually HP-UX) machine, using Anders Klemets porting kit. If I have success, I'll edit the guide to cover NOS.

What constitutes a decent carrier detect circuit? What should I look for
on the schematic of my shiny new PK-88? Should I even bother looking? If
it doesn't have one, can TAPR help?

Actually, now that I think of it, the instructions in the book are to
open the squelch and set the volume where the DCD light just comes on
solid...which sounds like a not-decent carrier detect. :-(

I have a few Gel/Cell rechargeable batteries that I want to use. My question
is what is the standard recharge voltage specs for these units? The battery has
only the following marking:
     Globe Battery Division
     Gel/Cell rechargeable battery
     GC680 6 volt 7.5 Amp Hr

A list of book references on battery would be welcome.
John

Well I have gotten a few responses from people on possible cures for my interference problems. For those who haven't seen this, I am trying to use and Atari portfolio on packet radio with a Kenwood HT. The portfolio causes a whine right at 145.01 Mhz (also at 223.40 Mhz on another Kenwood HT). I have confirmed that it is a radiated interference, it is not being transmitted through any of the cables. It is quite strong and does not diminish very well with distance (I put the antenna across the room and the signal seemed louder!). I think I need some sort of sheilding on the Portfolio but I am not sure that is even feasible. I think I heard of some sort of conductive spray that might work but I don't have any particulars, any ideas?

For the people who inquired about my setup, I am using the Portfolio as a terminal running Xterm2 by Jim Straus. This is a terminal program for the Portfolio that supports xmodem and ascii transfers and programable function key strings. It is quite nice and still less than 3k in size. I have been looking for something geared more towards packet (like yapp or pakcom (?)) but most of what I have found is too big (30-60k will work but is too big just for a few little features) It looks like I may have to do it myself.

Well thanks for any info/help you may have.

Pete Borders WB4TKA (just using a friend's account)

P.S. Our mailer can't get through to pr@NFSnet-Relay.AC.UK so if Peter Robinson wants to supply an alternate route let me know.

If I'm designing my own TNC, what should I do for carrier detection?
Is a phaselock detector on the PLL that discriminates the tones an
adequate data-carrier-detect function, or do I need something else,
like maybe a combination of phaselock and a particular AGC level?

You can't expect to charge a 7.5 AH battery with 4.1 A for 1 hr...
    (4.1A * 1.0hr = 4.1AH < 7.5AH)

For constant current charging, try charging with a current of 0.1 the
AH rating of the battery (in this case 3/4 Amp). Ideally it would take
10 hours to fully charge your battery. Batteries are not 100% efficient

in storing the charge energy (some is wasted in heating the battery) so you should charge it a little longer, like 11 hours rather than 10. Don't leave it on the charger.

For constant voltage charging (which is what I do) use a voltage of 2.3V per cell. Your 6 volt battery has 3 cells in it, so 2.3 * 3 = 6.9V. Use an accurate digital voltmeter to measure this and don't exceed this voltage. It is better to be a little lower than a little over. Over voltage will destroy the battery over time. Under voltage will only cause your battery to be less than 100% charged. You can maintain a constant-voltage charge indefinitely (called a "float charge").

There was a good series of articles (three of them) in consecutive issues of QST magazine (Jan, Feb, Mar 1990 I believe) regarding the use of lead-acid batteries. Much of the information was directly applicable to gel cells (which are a type of lead-acid battery).

There are circuits that will charge your battery quickly at first then switch over to a maintaince float charge to keep it fully charged, but I won't get into that... just so you know.

>X-Mailer: Mush 6.5.6 (PC R6.3 22-Sep-89)

I have been on the phone calling every company I could think of asking about 9600 baud packet radio. Here are the results:

PacComm: no longer in the picture. They have withdrawn their earlier NB9600 series and its successor is nowhere near production. "Six months, maybe?" was the answer. That probably means never. Their G3RUH modem

is still available, however, and plugs right into their own TNCs and TNC2 clones.

Kantronics: paydirt! The DVR2-2 (144MHz, 2W) works with the G3RUH modem at 9600 baud. Lists for $239US. Compatible with a 30W power amp from RF Concepts, list $129US. The whole thing is tested and works with a TXD of 4 (40 ms). All shipping now. The 440MHz version of the Kantronics DVR2-2 is not yet available. They expect to ship in mid-July. I don't have any idea how reliable this estimate might be. The Data Engine is shipping now, so there's something.

TAPR: the PacketRadio is still in neverland. Betatest has not started. Someone has the flu or maybe something more awful. They plan to offer it as a kit and also license it to commercial outfits. They figure the kit will be out in September but I really doubt that - their estimates have been very optimistic on this project so far. But I don't think it is fair to call it the "VapourRadio" (as funny as it is) considering that they showed the boards at Dayton.

AEA: nothing. The only data RF product they had has been cancelled and there is nothing up their sleeve. The PS186 data switch platform is in neverland. "You mean it's waiting for someone to make up his mind?" "Something like that." You know what they say: "Confused minds say No."

DRSI: The guy at DRSI told me that they are thinking about making a 4W data radio for the Amateur market which would be similar to the commercial ones they have made. Committed to the idea but no particular date in mind right now. A high-speed modem is currently a higher priority for some reason.

MFJ: - I didn't call cause I don't think they have anything and I was getting discouraged at this point.

BOTTOM LINE: There is no commercial 440MHz data radio available now. There are also none in the works, except for the Kantronics, Real Soon Now. The cost of the Kantronics is not known but will certainly be higher than the DVR2-2 at $239US. It probably also comes uncrystalled.

Now if any of you can suggest anyone else who sells data radios, or kits, or ANYTHING, please shoot me a note and I will update this list and repost.

Under the catagory of ANYTHING -), don't forget the Grapes 56k RF modem.
It is both the modem and the radio and you CAN throttle it back to 9600
baud if you insist.-)

On the topic of G3RUH 9600 baud modems, I have two and they work fine
with MODIFIED, CRYSTAL controlled commercial radios (GE). They are not
plug-and-play and they WON'T work with SYNTHESIZED radios. It seems the
PLL in the radio nulls out some of the spectral energy of the modem that
falls within the passband of the loop filter.-(

From Miller-Stephenson one can buy a can of "RFI Conductive Coating"
part # MS-485 (black, 16 oz.).
Recommended for Lexan, Noryl, Merlon, Cycolac, ABS, Styron, PVC,
   metals and other surfaces.

Advantages:
MS-485 is a black coating which may be applied in a 2 mil layer to
absorb RFI/EMI over a broad frequency range. It dries in approximately
15 minutes and is functional within minutes of application.

Safety:
Low order of toxicity
Does not attack plastic, rubber or metals

The above two paragraphs are verbatim from the can...I do not have
personal experience with the product.
Miller-Stephenson's corporate offices are in Danbury, CT.

I'm not familiar with the Atari Portfolio computer, but maybe you could find
its crystal oscillator clock and move it a few KHz. Assuming that you can get
at the actual xtal (that it's not a sealed rectangular can that includes the
oscillator ckt), try putting a small (about 5pF) cap across the xtal. This
might pull the harmonic off the freq of interest, and ruin reception on some
other freq! If it is a sealed module, maybe replace it with one with a freq a
fraction of a % higher or lower. Watch out that you don't adversely impact
some critical timing, like a modem circuit.
**This is not a high quality fix, as all you're doing is pushing your RFI to
another frequency. But if you just want to operate the one frequency, and you
don't have any neighbors into radio, you could get away with this.
>>best is to eliminate the RFI, if you can.

Hope this helps   WA2ISE

As part of a planned upgrade to the local network we are in the process of evaluating the performance of the various 9600 baud modems. We would appreciate hearing from anyone using any of the available modems. While measured performance would be the most valuable, even subjective comments would be welcomed. Information on their performance in regenerative repeater applications would be particularly welcome.

As usual please EMAIL your responses to me and I will summarize for the net.

Thanks

You might consider Miller-Stephenson "MilShield" Conductive coating,
part number MS485 is an aerosol can. Applied as instructed they claim
it gives surface resistivity of half an ohm/square. I think a can
costs around $6 or so but I make no claim for the product other than that
I have used it in the past (coated a homebrew fiberglass parabola with it
and it worked fine through 10 GHz).

  Sb: speeding up Uniden 2510 AGC

  For those of you who are using a Uniden 2510 for packet, you can
  speed up AGC speed considerably, just by removing the AGC SSB switch
  transistor Q-111 This transistor switches the AGC off for CW
  operation, and on for SSB operation. All I did was remove it and my
  radio now works with very good speed on 10m. You may put a switch
  between the pads that were for collector and ground. When you want slow
  AGC turn the switch ON pulling line to ground. For fast agc turn
  switch off leaving line floating. That is all there is to it.

  The description of the mod for the 2510 may work for the 2600.
  Those who have the Uniden 2600 may find that the AGC is the same for this
  radio. Look for NJM2902 IC (this is the AGC amp), you may find a
  transistor connected thru a RC network, to pin 12 of said ic. Remove
  also. (this mod not tested!)

  Ciao de Chuck ti3djt @ ti0paq.cri.na

Note: I haven't tried or verified this, proceed at your own risk! WA2ISE

I have been looking for a newer version of NOS or NET
for Unix. The version I have for NET us 890421.1a (unix)
Several things are broke, TELNETD, the mail box goo. I
have fixed some of the bugs with it but it still

hangs on a msgsnd() every no and then. Can someone out
there let me know the IP address of the host that is
the keeper of the currrent NOS/NET Unix bits.

I am also looking for a local site to feed me the tcp-group
mailing list either via news or standard mail. If you can
help me out please call me at 277-7413 after business hours

Thank you!

the home of unix for nos is sics.se [192.16.123.90] but it is a
slow ftp from here. from a recent posting to tcp-group:

From: klemets@sics.se

> What are the various Unix versions of NOS? Where are they?

You will find them at sics.se in the directory archive/packet/ka9q/nos.

The archive nosunix.tar.Z contains files for BSD UNIX that have been
tested on Sun-3's with SunOS 4.0 and NeXT's. It also contains files
which I have been using for UNIX System V release 3. These may be
slightly out of date however.

The archive lwpnos.tar.Z contains files for the Sun-4 (e.g. SparcStation.)
The files will also work on any other machine that uses SunOS 4.0,

such as Sun-3's.

If you run NOS like this on a BSD system you can make it talk to the native IP code using Julian Onions "Tunnel driver". This driver is installed in the kernel and allows you to route IP datagrams between the kernel and a process in user space (e.g. NOS.) If you are on packet radio, this is an excellent way of making your BSD system available on the radio channel. It is definitely much cheaper than buying a PC to use as a dedicated router, as some may suggest.

The version of the Tunnel driver that I was using had a bug in it, that had to be fixed. This bug may have been fixed in later versions, but to be on the safe side you should consider using my corrected version of the Tunnel driver, which is in tundrvr.tar.Z.

The AX.25 STREAMS module for SunOS 4.0 and UNIX System V is in streams.tar. I am still seeking for volunteers who would like to turn this into something useful. The idea is, as presented in the ARRL CNC paper, to build a stack of protocol modules on top of this module. I began writing ARP and IP modules. One would put a TCP STREAMS driver on top of them. In user space there would be a couple of routines that mimic the BSD socket interface using the STREAMS driver.

The archive netnix.tar.Z contains my special version of NOS that takes advantage of the multitasking in UNIX. It implements a client-server model with the protocol stack in user space, using semaphores and shared memory. It will work on machines with SunOS 4.0 and on UNIX System V.

The NETNIX files have just recently been updated thanks to Scott Bertilson. He corrected a couple of bugs, such as a problem with the semaphores that would cause erratic behaviour under some circumstances. I had been puzzled for quite some time by this bug. He also modified the serial port driver so that it would be more efficient.
Users of NETNIX are therefore encouraged to upgrade to the latest version.

The NETNIX distribution is self-contained. That is, you are not supposed to merge the files with a recent version of src.arc as with the other UNIX versions of NOS.

Good luck,
Anders (SM0RGV)

I have a unix box at home with many ports. I have a 50 watt kenwood 2 meter unit with an antenna 70 feet high. I want to run a multi user Bbs. Any one know of a TNC that allows multiconnect with only one radio?

Please reply via email as I do not usually read this news group.

Actually, MOST of the commercial TNCs offer multi-connect capability, but not as you perhaps envision, with lots of serial ports.

What you can do is to put them in multiconnect transparent mode, and demultiplex the incoming streams yourself. For example, in the MFJ1270, you can tell the software USERS=10, CONM TRANS, and STREAMDOUBLE. Then each separate connections will be preceded by a two-character flag such as |A or |J or whatever. Your software can then split these up into separate streams, and prefix the responses with the appropriate stream switch characters to direct output back to same user.

I've been thinking of cobbling up something like this with a BSD Unix
pseudo-tty interface (like the 'uw' package) so that up to 10 users
could have pseudo-ports on a single serial port on my workstation using
only one tnc and radio. Haven't done it yet, but it seems feasible.

Hello Folks,
 I have obtained a copy of NOS_0329 but I have no examples of
the autoexe and domain files that go with it, could some kind sole
mail me an example of the format of these. I assume that the auto file
is similar to the previous NET s/w but the Domain file is different
to the hosts file. I previously have only used the ATARI versions
but now reluctantly have bought a PC clone.

I released a user reference manual for NOS several weeks ago. It can be found on flash.bellcore.com (128.96.32.20) by anonymous FTP. The file name is /pub/ka9q/userref.nr. This is a nroff/troff source file; it should be printed with the command "nroff -ms userref.nr" or "troff -ms userref.nr".

For those of you without access to nroff, I have placed an nroff'ed version of this file in "userref.out" in the same directory.

I have been using the 0329 version of NOS for quite awhile here, without much trouble. After getting the preliminary NOS documentation, I decided it was time to drop the 0418 version in place and start using the current stuff. When I did, I found that the only time my system would actually key the transmitter, was on startup of NOS (I would imagine that the "netrom bcnodes" is what went out). After that, if I do a "finger", "connect", or any other type of connection to another station, the transmitter never gets keyed. The 0329 version, with the same environment works like a charm. The interesting thing is, the AX.25 timers are running, and retrys are occurring, even though nothing is actually being transmitted. Eventually, the "connect" attemp times out.

My configuration is:
- 8088 XT @ 8 Mhz

- com2: (8250)
- MFJ-1270 TNC

Any help? I have the sources and can apply patches. I haven't seen the version of NOS on "flash" change since 04-18-90.

I just saw an ad for the Kantronics "Data Engine" TNC(?) in the June issue of QST (surprise, I am a member of ARRL). I certainly do intend to call up Kantronics and ask them all about it, but I'd like to find out what people here know about this thing. Can someone who might happen to know more please post what they can? One thing I did notice is that they claim this has an "open architecture" and a "developers technical reference" of some sort.
I tend to disbelieve, so I will have to see it to believe it that this thing is going to be an easy platform to develop new ROM code for. We'll see.

Yeah, so? OSI's TP4 is almost exactly TCP/IP -- that's no secret.

I spent quite a while at Dayton with the Kantronics folks asking questions
about this box. It's based on a V40 processor. It will accept 512k of ROM
and 512k of RAM though it ships with 64k and 64k (thats bytes not bits).
It is designed to be an open data engine that can drive two 56k baud ports
and a 19.2kb async link simultaneously. Their developers guide will include
full schematics and address maps. The modems can be daughter cards internal
to the box or external via connectors on the back. They include one 1200
baud daughter card modem with each unit shipped. They have available
prototyping daughter cards for your own modem designs. The external
connections have been tested with the G3RUH 9600 baud modem and the
Grapes 56k modem. Since the architecture is similar to a pc, you should
be able to port code developed on a pc to the data engine rather easily.
The software that ships with the box is very similar to the KAM. The
hardware physically looks very good (nice clean layout). Whether we need
a "super tnc" is of course another question altogether. As a two port
high speed switch with a lower speed tap (19.2k to an ordinary kiss tnc),
it has possibilities. It also might serve as a telebit substitute on
a Unix (tm) box.

I like it!

Mark,

I have been using two KPC-2's in KISS mode for about a year, and have
found them to be the most reliable part of my station. The only thing
about them which I'm not real sure about is the DCD-modem combination.
Kantronics uses the 7910 modem chip, and doesn't have a true "state-
machine" DCD circuit. Rather, it regards any channel activity as
a detected carrier. This doesn't affect things too much on VHF, but
on HF it might be a hassle.

Nevertheless, I remember reading in one of the Packet Conference proceedings
that the 7910 did a better job on noisy signals than the TAPR 2121/2122
circuit. I can't remember which conference and I'm only 80% sure
of this information.

Regarding the DCD circuit, 73 Magazine recently ran an article about
retrofitting a TAPR state-machine DCD to a Kantronics TNC, so even
that little problem (if it is one) can be taken care of.

Cheers,

Marshall Jose WA3VPZ

Has anyone gotten a G3RUH 9600 baud modem working on any radio on 220 MHz?
If so, could you please specify what radio, and any other personal experience
that you may have had with these modems. I am especially interested in any
reports of problems using them with PLL radios.

I am aware that they are a "plug and play" with the new Kantronics DVR units,
but Kantronics doesn't make one for 220. In addition, the TAPR packet-RADIO
seems to be pretty well bogged down, and their beta test models are now

going to be strictly on 2 meters vice both 144 and 220 MHz.

Any "hints or kinks" would be MOST appreciated!

Thanks for your time.

I picked up a 2m rig and a tnc-1 at the b'ham fest. Until now,
I have been so busy with other aspects of amateur radio, and have
ignored packet. Now I am interested :-)

Any pointers to what I can do with this would be appreciated.
It came with eproms for WA8DED and KISS, as well as the original
firmware.

I managed to connect to a local bbs using wa8ded firmware, but
I am sure that some of you out there have a lot of good information
concerning operation, etc. Thanks in advance!

> If you have access to a voltage regulated power supply, adjust it
> *unloaded* for 2.43 volts per cell for lead acid battaries (or 1.43
> for nicad's). When the current drops off to a few milliamps, the
> cells are charged.

Nicads have a phenomena where a constant voltage source can cause
a thermal runaway condition. Just after full charge, heat begins
to build up in the battery resulting in a decrease in resistance,
an increase in current, an in increase in heat, less resistance,
more current, etc. You can see smoke, sparks, spraying hydroxides,
explosions, etc.

Limit your charging current to C/10 where C is the 1 hour capacity
for standard charging and charge for 15-16 hours. Quick chargers
have thermal detection circuits or something more sophisticated
to know when to stop charging and drop to trickle charge (C/50).

I always slow charge my nicads and frequently leave them charging
for 24, 48, and even 72 hours with barely perceptable heating.
The charger is current limited by 18 volts through 75 ohms for
1200 mah packs. I also run the packs down SLOWLY to virtually
0 volts (low current and equal cells is not likely to reverse
a cell) and have never seen a hint of life shortening in the
year and nearly 100 cycles I have used them.

Hi!

A friend of mine and I want to get into packet radio. We are not hams. We are willing to jump through the necessary hoops. We both are software/ hardware engineers and understand various amounts of circuit theory. We would like to know:

1. What is the highest speed modem usable on standard packet frequencies? I have heard of 9600 bps modems being used. What about Telebit Trailblazer spread-spectrum type modems?

2. What class of ham liscense is necessary to run packet? What tests and theory must we have to get this liscense?

3. How much would a rig capable of 2400 bps operation cost (used)? I already have a 386 machine. I would like to upgrade to national/ international coverage (if that is applicable) and also to higher speeds.

4. I have heard that you cant upload messages/files to someones node and then have that information automatically forwarded through a network. Someone told me humans had to intervene. That sounded silly. Kinda defeats the whole purpose of a network, no? Sorry.. since I'm mostly a pc hacker I not quite sure how to ask a lot of questions without sounding naive.

5. What is a good book to get started with?

6. It seems like I have been trying to get into packet/ham for the last 5 years or so and always fail to clear the morse/test hurdles. I'd like to remedy this as soon as possible. Any ideas for making the transition easier?

Yours in communications,
Jim Burnes

The subject line says it all.

If not, why not? Micro-RTX could easily provide the requisite multi-tasking
kernel if the one that's included in the NOS source isn't suitable.

We ST users wait with bated breath! (especially we who still have older
520's :-) :-})

(I am posting this for a collegue, hope this is the right place)

A friend is looking for software for his Apple II+ to receive
Facsimile (he already has the interface to his radio) for example
of wheather maps. He would like also a piece of software that
implements the RTTY protocol.

If software is unavailable, we would settle for the algorytms.

Please respond through Email as this site doesn't receive any of the
rec. groups.

PPS: Please don't laugh, this is all foreign to me.

Well, there has been some discussion recently here about how most hams
with TNCs are using horribly outdated and slow equipment. 1200 baud
seems to be the lowest common denominator. And, sometimes I get the
feeling that some hams don't have much desire or incentive to move to
higher baud rates. In fact, I spent a while talking to the "packet
expert" at a local amateur radio store recently. I asked him about
some TNC that had a 2400 baud modem vs one that had a 1200 baud modem.
I asked wether 2400 would catch on, given my experience with land line
modems where everyone was starved for speed. He said "no." His
reasons seemed pretty fuzzy to me, but he seemed to claim that 1) 2400
baud wouldn't catch on because everyone already has 1200 baud modems,
2) 1200 baud seemed fast enough to him, and 3) that 2400 baud wasn't
really twice as fast as 1200 because the extra speed was used
inefficiently. (But don't hold me to that, this was a while ago.)

Anyway, my question is this: How can we "hams in the know" encourage
the use of faster and more effecient modems on the airwaves, given
that we agree that "faster is better." One of this guy's arguments
holds weight in that there is a lot of "hardware inertia" out there.

Specifically what kind of faster and more efficient modems are
available and suitable for packet-radio? How fast is fast? 9600?
19.2K? 56K? How much extra bandwidth do these faster modems require?
What about FCC regulations on speed?

Is there such a thing as auto baud rate recognition that would allow a
digipeater to work a several different speeds with different stations
on the same frequency? This would allow a smoother transition to

faster modems by giving people incentive to buy them without
immediately obsoleting everyone's 1200 baud equipment?

Would it be a good idea to set up digipeaters that work on several
different speeds (and frequencies) as a way of encouraging higher baud
rates?

Just curious,

I received some email from W3OTC that I responded to, and thought a
posting would be appropriate. Here it is:

% From: Robert Carpenter <rc%cmr.ncsl.nist.gov@usc.edu>

% Am I missing something? It seemed to me that you wouldn't benefit from a
% low duty cycle when fighting a large path loss.   I would think that some
% synchronous system, with correlation detection of some sort, would be the
% best bet. Of course you COULD build a receiver that just listened during
% the narrow pulses to ignore the in-between noise. I'd also worry a bit
% about pulse-spreading due to multipath. Maybe a pseudo-random scheme would
% be a good approach, but would likely have a mid-to-high duty cycle, and thus
% not be pulse.

It is a possibility to build a receiver that only listens when a pulse

is supposed to occur, but that wasn't necessarily what I was thinking about. The advantage of using the high peak power of a pulse is that it would be EASILY DETECTABLE even with high path loss. This means that (in theory) you could set up a data link much like CW is used with the human ear: the presence of a pulse has one meaning, and the absence of a pulse has another. There is probably even a better way to do it: consider what you could do if you were to phase modulate the pulses. In other words, control the time delay or latency between pulses. A short time delay could mean a 0 bit, and a long delay could mean a 1 bit.

% Or do you have a good source of low duty cycle 10 GHz power, and want to
% build a system around it?

No, I don't have a 10 GHz pulse source, but they are available. Now if we could only use them legally ...

% Pardon the confused questions, but I don't normally think of low-duty-cycle
% pulse transmission and weak signal operation as going together.

Most people don't. Certainly, I'm not suggesting that real time communications like voice be sent this way. I'm merely proposing that this might be a good use for part of our microwave spectrum. The packet guys are in great need of high-speed inter-city links (among other things).

% Bob W3OTC

% PS. Look at the picture of the 10 GHz SSB PHONE station in QST (I thought in
% W3XO's column, but can't find it.) I've seen and heard '3XO's video of it
% operating over a non-line-of-sight 25 mile path with excellent sigs.
% The power output was in the 20 - 100 mW range, I think.

I've done better than 40 miles over non-line-of-sight paths with only 10 mW and CRUDDY WIDEBAND FM! This was with 2 foot dish antennas on both ends of the path at X-band. Still, I'm not pooh-poohing their efforts; I'm just trying to show that even with simple cheap equipment you can do a lot more than most people expect in the SHF and EHF spectrum.

In article <1250147@hpnmdla.HP.COM> glenne@hpnmdla.HP.COM (Glenn Elmore) writes:
% Ken,
%   I don't think pulse privileges really are that much of an issue in
% preventing effective use of the band. As I see it, the main advantage would be
% in using surplus hardware.

Yes, this would be the advantage. I'm not suggesting that we have an
undue hardship with the pulse restriction; I am suggesting that it is
arbitrary and capricious, and that if we didn't have the restriction,
there would be one more possible way that we could effectively
communicate on the band.

% However, moderate power narrowband
% equipment is no longer a difficult proposition. Very long links and
% OTH links require optimum use of the resources; reasonably efficient
% use of the spectrum (bps/Hz numbers) and highly directional beams to
% avoid waste and QRM; as well as physically larger receive antenna apertures
% to recover the information. Even so I suspect that for reliable networks and
% comm. channels we are likely to end up with a larger number of shorter LOS
% links instead of long haul OTH ones.

This may be true. However, I don't think anybody has ever experimented
with using high-power low-duty-cycle signals to build a packet switched
microwave network. My idea might not pan out to anything, but on the
other hand, how will we know unless somebody tries to do it?

% Troposcatter is a fairly predictable
% propagation mechanism at 10 GHz (see my description of an
% experience with it on a 400+ mile path during the 1987 10 GHz terrestrial
% DX record outing in December 1987 QST) but long haul links are inherently
% lossier and less reliable than shorter LOS ones.
%   I strongly agree that we need to use our microwave resources and in
% particular 10 GHz but I think we will end up finding that for efficient
% use of our amateur resources we will start looking more like the telephone
% companies and common carrier folks when we solve the backbone problem.
%
% Glenn Elmore -N6GN- N6GN @ K3MC   glenn@n6gn.ampr.org glenne@hpnmd.hp.com

Sure, we might wind up looking like the telephone companies. Maybe they
have already tried the pulse idea. On the other hand, I have never
heard of it. If nobody has yet tried it, to see what the results are,
what is wrong with us amateurs giving it a try. It just might be
useful.

For sale once again:

MFJ 1247 HF/VHF TNC. Almost never used (yes it works).

LED tuning display. Compatible with MFJ WeFAX software (for PCs and
Macintoshes). Personal mailbox.

Comes with 5-lead RS232 cable and homebrew connector to use on Icom IC2AT.

Bought for $150.00 at Dayton. Asking $125.00. May trade or bargain.

>available and suitable for packet-radio? How fast is fast? 9600?
>19.2K? 56K? How much extra bandwidth do these faster modems require?
>What about FCC regulations on speed?

At the risk of sounding a bit commercial, I'd suggest you buy some of
our GRAPES/WA4DSY 56kb modems, some transverters (or better yet, design
some inexpensive transverters and make kits available.), design an
application that will provide a needed or desired service to the
ham community and then hit the packet demo trail just like we did
4 or 5 years ago. Build a portable station, go to ham clubs and the
like and demonstrate this valuable user service(s). Emphasize the
benefits provided and de-emphasize the hard-core technical aspects.
You will have provided the incentive for the user community to
upgrade and they won't even know it happened to them.

What kind of applications? Here are some off the top of my head:

*   Realtime Database services (callsign database, gridsquares, etc)
*   Realtime WEFAX/NOAA weather map distribution.
*   Voicemail store-and-forward and mailbox services.
*   Realtime wide area chat or "CB" conferences.
*   Remote execution (so ya wanna do a PCB but don't want to buy
     pCAD? Nooooo Problem.)

In terms of bandwidth, the GRAPES/DSY modem uses about 1.1 hz per
bps and so requires about 75 khz of bandwidth at 56kbps. The bandwidth
is fairly sharply limited so splatter beyond these bounds is not a problem.

And the signal within the bandpass sounds like white noise.

In terms of rules, before the great ARRL/FCC rules rewrite, this type modem could be used at 220 mhz and above. Now that we've been "represented" again by the ARRL, 220 is out. But anything 440 or above is fine. The low power and wide bandwidth minimize interference with other services.

>Is there such a thing as auto baud rate recognition that would allow a
>digipeater to work a several different speeds with different stations
>on the same frequency? This would allow a smoother transition to
>faster modems by giving people incentive to buy them without
>immediately obsoleting everyone's 1200 baud equipment?

Unfortunately, the modulation schemes, bandwidth, linearity requirements and the like vary widely enough that nothing short of a linear translater could handle all the protocols on the table. The solution is to simply and temporarily hang a 1200 baud port off the side of the server and give it limited services - sort of a tickler.

If you do this, you will ease the user community into the new standard and at some point in the future, the 1200 baud stuff can be turned off because it is no longer used.

John

I'd like to echo Bob's comments and expand on it a bit. In particular,
the problems being experienced commercializing these fine products.
I suspect that the Awesome IO board is suffering from the same problem
as the DSY modem.

Over the past 2 years, I've personally contacted the heads of most of
the packet-oriented hardware vendors regarding the DSY modem - not as
a GRAPES representative but simply as an enthusiastic ham who knows
something about the product.

The story I've gotten almost invariably has been almost identical in
each case. The problem is ALL VENDORS ARE DEMANDING EXCLUSIVE,
PROPRIETARY LICENSES TO THE TECHNOLOGY. In other words, these vendors
are wanting to take the work contributed by a number of hams, and hog it all
to themselves. This, of course, is totally unacceptable. Think where
packet would be today if TAPR had not standardized a protocol and an
implementation.

I know for a fact that Dale's license terms are very, VERY reasonable,
almost bordering on the trivial. So here's the prime opportunity for
someone with a little cash and some time laying around. Grab a license
for the DSY modem, get one of the capable designers design you an RF
front end and make a product out of the modem. Dale's modem is very
elegant and easy to build and uses nothing exotic.

Meanwhile, for the rest of you, perhaps the next time you have an
interaction with a vendor, you might ask them why they're being
so greedy.

I have done a *lot* of thinking about this problem. Given that amateur radio is a voluntary, personally funded activity, you can't force hams to buy new hardware. But there's another approach: establishing a frequency allocation policy that encourages the use of more efficient modulation and frequency reuse techniques. The more efficient your proposed use of the spectrum, the more likely you are to get an allocation.

Amateur frequency coordinators now follow a first-come first-served policy, and this *must* change. In many areas like Los Angeles and New York, the VHF/UHF bands are nearly full with FM repeaters and conventional 1200 baud packet, and there is little room to experiment with newer, more efficient techniques. This backward-looking policy has many costs:

1. We do not make effective use of our allocations, vis a vis other services (e.g., land mobile). This leaves us highly vulnerable to spectrum grabs.

2. It contributes to a mindset that because the bands are "full", we must impose irrelevant, arbitrary licensing requirements (like a code test) to avoid congestion. The result is stagnant growth in the amateur service at a time when other users of spectrum are growing explosively, and this also leaves us open to spectrum grabs.

3. We do not fufill our mandate of developing new technologies, and this again contributes to a perception that amateur radio just isn't worth the spectrum allocated to it.

There is a lot of irony here given that the ARRL's main argument against the takeover of 220-222 MHz was that extra spectrum should not be necessary to deploy new, spectrally-efficient techniques -- they should be used in the existing land mobile bands. Do as we say, not as we do, I guess.

Recently the Bellcore radio club hosted a talk by an engineer who works for the NYNEX cellular radio system. I was impressed by the amount of traffic they carry in only 20 MHz. It's all done by careful selection of transmitter sites, real-time control of power levels, and heavy use of computer and data

communications technology both in the base stations and in the mobile units. In contrast, amateur VHF/UHF voice technology is virtually unchanged in 20 years (being comparable to the old IMTS mobile telephone systems that cellular radio replaced), and our packet technology is hardly better.

Sooner or later, more efficient modulation and frequency reuse techniques *will* appear on our bands. The question is whether or not they'll be amateur stations.

Marc:

I believe that for hams in the US, it must be made into an appliance. For this reason, I have worked extremely hard to bring DSP to bear on the problem of modems for ham use and at the same time to keep the cost down. Hams are basically cheap and these days they are basically technically lazy. They LOVE to play with and explore the use of technology and can get more out of a technology than almost anyone else. However, the actual initial implementation must have been done by `someone else.' If the ham radio manufacturers had to pay real engineers, real salaries to do their design work, we would never see this technology cost a reasonable amount. My efforts in this area along with partners KB2CST and KA2MOV

for commercial concerns and with WA7GXD, KV7B, W3IWI for TAPR and AMSAT
have essentially been done for free. The man year of software development
that has gone into this would have cost `real engineering $$' so much
that the products would be as much as a good transceiver. About another
man year in software development must go into these products before it is
the true be all and end all for medium to low(audio) bandwidth modes.
With a desperate need for new technology on HF and multiple modems needed
to work satellites, ROBOT 1200C's costing a fortune when you can get them
for SSTV, WEFAX APT equipment costing a few hundred, etc. etc. It has just
gotten too expensive for a ham to `do it all' with individual pieces of
equipment. For these applications, a several hundred dollar box/board
that `does it all' (IMHO, such as mine) is the answer.  For truly `fast' digital
comm., Dale Heatherington's 56 Kbps modem technology and Glen Elmore's 10 Ghz
work is the way to go but Dale/Grapes are gonna have to license it
to someone for sale as a completed unit or it will never catch on. We
have also suffered another set back with the Totally Awesome IO board
project. Its commercial license was never completed and those efforts
have now fallen through. IMHO, with the DSP work that I have been leading,
the 56 KB stuff that Heatherington/Grapes is pushing, Totally Awesome
IO from K3MC/N6RCE, 10 Ghz-megabit stuff from Glen Elmore, TCP-IP from
KA9Q, we have ALL the technology we need to lead us into 21-st century.
We must make `everyham' an integral part of the total conversion to
the new information technologies and give them plenty of room for expansion/
experimentation such as with the OPEN ARCHITECTURE DSP stuff, and Karn's
`open architecture' approach to TCP/IP, etc. We must find a creative
solution to the distribution of this technology to hams.

Bob

I have been monitoring for DOVE for a coupla days, and haven't heard a peep.
I listened (an heard) when it was first up, and went back for more this week,

to no avail. Is it still alive? I'm listening on 145.825 MHZ.

>What about FCC regulations on speed?

There are three main classes of higher speed (>= 9600 bps) modems now available:

1. 9600 b/s noncoherent FSK in a standard 20 KHz FM voice channel, usually using modified voice radios. The K9NG modem was the first design in this class, with the G3RUH design following suit. TAPR distributes K9NG kits, while G3RUH's modem is commmercially available. Complete 9600 bps RF modems that do not require an existing voice transceiver are in various stages of design, production engineering and test at TAPR, AEA and GLB, but I believe that none is yet actually on the market.

2. 56 kb/s MSK in 100 KHz channels on 220 MHz or higher. This is the WA4DSY design that has been sold as a kit by GRAPES (the Atlanta-area packet organization) for several years. This unit does not use a standard voice

radio; when combined with a transverter, it is a complete RF modem. I've
been using this one myself for the past two years with excellent results.
See my review in the October 1989 issue of 73.

3. 2 Mb/s noncoherent FSK on 10 and 24 GHz, as developed by N6GN and N6RCE
over the past year or so and written up in the December 1989 issue of Ham
Radio. This one has the biggest potential of all, as it could be used as
the basis of a dedicated backbone network carrying not just "packet",
but also voice and facsimile images. It appears that increasing the
speed of this system to 10 Mb/s or more is fairly straightforward. A
single link operating at this speed could carry 156 simultaneous
telephone-quality voice QSOs!

>Is there such a thing as auto baud rate recognition that would allow a

>immediately obsoleting everyone's 1200 baud equipment?

This is not easily done because the better techniques for sensing carrier
on a shared channel depend on the receiver knowing the data rate (and
modulation method) in use.

>Would it be a good idea to set up digipeaters that work on several
>different speeds (and frequencies) as a way of encouraging higher baud
>rates?

Yes. This is actually being done (with IP routers and NET/ROM nodes rather
than digipeaters) in our area; we have a 56kb/s TCP/IP channel on 220.55
that is gatewayed to the NET/ROM network on 2m and 70cm.

  The U.S. Navy has commissioned a multi-media test of ship-shore

data communications. Particular media under test:

- HF communications
- Fleet SATCOM (2400 bit/second US Navy satellites)
- INMARSAT Commercial satellite channels

  It is believed the HF communications portion shall include a packet radio test.

  SPAWAR Code PMW-156 (Capt. Joesph Price, USN) is coordinating the test at the direction of VADM Jerry O. Tuttle, USN, OPNAV Code 094. The testing agent shall be the Naval Engineering Center at Vallejo, CA. The test platforms shall be ships assigned out of San Diego, CA. The test is lated to begin this summer.

  Mission support data shall be transferred from an aircraft carrier to shore based NARDAC, Naval Regional Data Automation Center.

cheers...

(dig, dig...ok, I found it.) [putting on President, Texas VHF-FM Society hat]

You've beat this drum before, and I've argued it before. While your idea
has merit in a perfect society, it *cannot* work in the real ham world.

Frequency coordinators now serve in an advisory capacity. You'd like us
to tell people who have coordinations and are currently operating
repeaters on frequencies where they do not experience regular,
significant interference (the standard which coordinators try to
maintain) that, all of a sudden, the rules have changed, and that they
must either shut down entirely, or accept unheard-of, and previously
unacceptable, levels of interference.

They wouldn't listen to us.

Instead, they'd keep on operating on what they perceive as *their*
frequency. You know that they don't own it, I know it, but they don't -
and they're the only ones with the power to make such a change work.

Frequency coordination and spectrum management isn't just a technical
problem, but a highly political one as well. Come up with a way to
accomplish your goal that *can* be accepted by the population of current
FM voice system operators and users, and your wish will come true, and
I'll sign up to promote it. This isn't the school debate society,
though, where changes can be implemented by fiat. You must account for
the mechanisms involved in implementing the change, and _that_ is where
your problem lies.

Hello All,

I'd like the benefit of people's experiences concerning what to do when your local 2m 1200bps single channel based network begins to overload.

Our local packet network is at breaking point for about 50% of the time. To put the network under a more 'formal' basis we had a meeting of all local packeteers with the aim of creating a group to maintain and enhance the network. Various suggestions were made on how to solve things, some good, some bad. Here's a summary of the network as it stands:-

NB - My local area is Bath/Bristol/Cardiff (S/W England & S Wales)
Total population ~1 million - Amateurs on packet ~300

90% of traffic sits on 144.650 all 1200bps - Local chats and node traffic.
Some links now exist on 70MHz - mainly for BBS forwarding.
There are 2 major nodes on 2m - They are on very high sites running 25W erp consequently they hear a lot and lots can hear them.

Perhaps a greater problem is that most routes out of our area are poor and they also must talk to well-sited nodes. It not unusual to have stations telephoning node sysops because they think the node is down - when its due to the node hearing so much that its squelch is permanently open!
Most of the nodes in our area form backbone links in all directions and the NTS Mailboxes rely on them heavily.

The basic idea is to move the well-sited nodes into lower 'city' locations keep them as the user access points and then tie up these nodes on separate links (4m/70cms/23cms). Where to put the links is a moot point - 4m has a source of cheap PMR equipment but no bandwidth - 70cms more expensive, more channels but it's not a primary band - 23cms expensive but plenty of wide open space.

What I'd like are your thoughts/experiences/suggestions etc. Particularly why you chose frequencies/data speed etc.

As a final note - one of the things that I noticed at the meeting and while talking to the local users were :-

1) People need to learn that the packet system needs to shunt data fast. It's a serious network that moves data regardless of what the data is and how it gets from one point to another.

2) People don't understand much about protocols and the NET/ROM system eg. NOT realising that KA/NODES are not real nodes and trying to explain why p-persist will squeeze a few more % out of the network.

Thanks for your time & 73,

Mike

Here's the deal. I am the system administrator of a Public Access Unix BBS, and have been running a BBS at the same phone number since 1983. Being a consultant by trade, and doing all of my work at home, I can run the BBS, and also play ham radio day and night. I have a speaker from the ham rig in my computer room, and I have a video feed from the BBS monitor in my ham shack. The two hobbies sort of meld. I talk with other UNIX people on the ham bands, and send email to ham friends on USENET.

I am obsessive compulsive, I admit it and I use it to an advantage.

I do not have a packet system. Not today. I always managed to put it off.

The PBBS that serves this area of Upper Michigan is going to be going down soon. They are looking for someone else to run one.

A ham from Lower Michigan said he would donate a TNC. I agreed to supply what equipment I can, and am mulling over what is the best way to go. I have an old XTAL type 2m rig and a spare antenna to kick into the project.

I also have an AT&T UNIX PC with a 20 meg hard drive. Not much, but probably enough to run a PBBS.

Why the UNIX PC? (also known as a 7300, or 3b1)

Well I got to thinking how easy it would be, while reading rec.ham.radio on the console of the landline BBS, I could forward articles to the Packet BBS with ease, using UUCP.

Has anyone ever done this?

Would the 3b1 be up to the job? If so, I will also donate that to the project. It would be a great service to the hams of Northern Michigan to have selected articles from USENET ported over to our local PBBS. I will not do it if I have to haul floppies up a flight of stairs (The USENET site is on the ground floor, and my hamshack is one floor up).. BUT using UUCP would be a breeze.

Our own BBS software on lopez is locally written, so I can have any mods I want tossed in simply, and many I can write myself (The software STARBASE, is very configurable, and will eventually be made public)...

The trick will be to link everything together. I am sure it could be done with a XENIX type PC, but that route is beyond our meager budget.

Any ideas, thoughts, ponderings, musings, experiences welcome.

Thanks, es 73

Gary

Is there an FCC policy or other generally accepted rules regarding
putting shareware on packet radio BBS's? Is transmitting shareware
considered a "business communication"? What about freeware? Just
curious...

Anything thing you can do with Xenix on a PC, you can do with the Unix-PC.

A 20 meg disk might be too small - even a minimal news feed requires a lot
of disk space.

There is program written by the people at KA9Q called simply KA9Q. It is
a program designed to implement protocols like Telnet (a terminal emulator),
FTP (file transfer protocol), and others over packet radio.

KA9Q does work on the Unix-PC.

Using the KA9Q program and a pty driver would enable any Unix system to
receive Telnet and FTP connections over packet radio (not to mention SLIP/SLFP
connections from other computers).

Because of the pty driver (psuedo terminal), any Telnet connection would log
into the Unix system normally (via getty and login) just as through the
person had called in with a modem.

I'm sure other people on the net can help you with technicalities in setting
this up (I know nothing about packet radio other than what it is).

Good luck.

- Ron

Friends,

I work in a brazilian organization who also give
support for non-profits organizations. We work with a similar
organization, here in San Francisco Bay Area. We are about to get
authorization to use the PeaceSat, an old militar satellite now used
for pacific purposes, and we plan to use initially to get a cheap

and good link from our machines. I have no experience in this area,
so I am asking for help with some (maybe dumb) questions:

 - Possible baud rates

 - Hardware required

 - Places where look for hardware

Thanks very much for any help,

Saliel Figueira Filho
Chief Programmer

Does anyone have information about the fate of Teletext services in the US?
This is an information service that provides text and block color graphics
capability on a home TV receiver equipped with a special decoder. The data
is embedded in several unused TV lines in the vertical blanking interval.
The data repeats over and over in the form of a magazine. The decoder
simply grabs pages as they come by and stores them in a display buffer.
The system is very popular in the UK.

Zenith used to offer an embedded decoder on some of their sets. Also, Dick
Smith electronics offered a kit a few years back.

Observations on several local broadcast and cable channels show considerable
activity in the blanking interval.

Information on current status of Teletext and sources for decoders would

be appreciated.

I recall reading some months ago that this summer, an astronaut on the Space Shuttle will be doing 2 meter packet communications with earthlings.

When will this occur? On what frequency? Will it be possible for me to communicate with them using my BIG 5 watts of power? do i need a special antenna or will my rinkydink ones made out of coathangers do the trick? I expect QRM will be real bad, but the equiptment I got is what I'm stuck with ... I yam what I yam.

All help appreciated!

!! HELP !!

For about one year I'm looking for information on the
computer interface of the AR-2002 communications receiver.

If someone has hard- or software information about
this interface (or also about other interesting aspects of
this equipment) please send it to me by email to

    schot@dutentb.tudelft.nl

or on paper to:

    C.A. Schot,
    Grote Kreek 45,
    3079 CC Rotterdam,
    The Netherlands.

Even the name and address of the (I thought Japanese)
manufacturer of this scanner can help me.

Please, help me, because this is the last hope for me
to get this information.

>inefficiently. (But don't hold me to that, this was a while ago.)
>
     I also feel that 2400 baud will not catch on, but my reasoning is much different. 2400 baud is just not that much of a jump beyond 1200 to make it worth the trouble. Go for 9600 baud or 56kb (though 4800 baud seems to be a happy medium for many because it supposedly works with more radios than the higher speeds).

>Anyway, my question is this: How can we "hams in the know" encourage
>the use of faster and more effecient modems on the airwaves, given
>that we agree that "faster is better." One of this guy's arguments
>holds weight in that there is a lot of "hardware inertia" out there.

     The first step in taking advantage of higher speed modems is to use them on the backbones. The backbones are where the heavy traffic is anyway, and there is little "hardware inertia" involved. You could run some strange I'm-not-compatible-with-anything protocol and modem on the backbones and it wouldn't really matter.

     Many of the UHF backbone links of the network in Ohio are at 4800 baud. The NEDA guys have many 4800 baud trunks and are quickly moving for 9600 baud. Also, on the NEDA network, many of the high-volume users (DX clusters, BBSs, TCP/IP) are using higher speed uplinks to the backbone.

     There is never going to be an overnight switch away from 1200 baud. Like MS-DOS, it will dog us for a long, long time. Put the high-speed modems in the places will they will give maximum benefit and gradually people will migrate beyond 1200 baud.

My wife and I will be taking a cross country car camping
trip starting June 17th. I plan to haul a packet rig with
me. We have done the 2 meter mobile packet routine in the
past and have enjoyed it.

I would appreciate receiving any packet maps of the areas we
will be traveling thru. From past experience, you find
PBBS's in the strangest places. I would hate to miss one
because I didn't have their frequency.

We will be driving down the Alaska Highway, across Canada to

Manitoba, and eventually to Washington DC and back home
again the same way to Juneau Alaska. We will drive thru
British Columbia, Alberta, Saskatchewan, Manitoba, N. Dak,
Minn, Iowa, Wisc, Ill, Indiana, Ohio, Penn, MD and West VA.

Send the packet maps to me via packet or BITNET. My
addresses are KL7RH@KL7HFI or KL7RH@KL7AW by packet. I can
also be reached thru BITNET at JSDCF2@ALASKA.BITNET

Thanks.

Duncan Fowler, KL7RH

So thats how Phil manages to make all of the
conferances and yet still work on the ka9q code
and do his bellcore work.. He had himself
duplicated a few times. Lets see,
1 for belcore, 1 for tapr, 1 or amsat,
1 to sleep, 50 to answer his email, 1 to code 8-)....

From: lsuc!ncrcan!brambo!wwg@AI.TORONTO.EDU (Warren W. Gay VE3WWG)

I have uploaded to SIMTEL20:

pd1:<msdos.ham-radio>
DOVE3W13.ZIP   DOVE Sat. Telemetry decoder for files or HAPN.

This program operates on all compatible video cards including
Hercules. Colour is also supported. Input can come from a previously
captured file or it may come directly from the Hamilton Area Packet
Network (H.A.P.N.) AX.25 card as the satellite screams overhead.
NK6KTLM format is also accepted without editing. Output can be a
updated screen display or to a report file if output is redirected
(format auto-adjusts).

[--end forwarded message--]

Thanks, Warren!

This is news to me. I'm still running 56kbps on 220.55, and as far as I
know it's still entirely legal.

Dear friends ---

I will be returning home to Kuala Lumpur, Malaysia, at the end of May. I have
been operating N3FLX while in the States. I plan to be active on the OSCARs
and Moonbounce from 9M2 land.

If there are any hams out there who would like to dispose of any items that
may be useful to me, I will greatly appreciate that. I am looking for items
would enable a good satellite and moonbounce (2m and 70cm) stations to be
setup. My moonbounce experience was gained at K3CR (Penn State Amateur Radio
Club station) and taught by AF1T (2m WAS #100). It is my dream to finally
setup a super-duper moonbounce station.

So, if anyone would like to donate any items of interest, please e-mail
directly to me or through packet. Until then, 73 and hpe to cu soon.

Ahmad, N3FLX/9M2DX.

IMHO: Any kind of shareware, begware or crippleware software that depends on the user base to disseminate itself and compel people to "register" or otherwise send money to the author is a business transaction if transfered over amateur radio. That is, by using packet radio to distribute this kind software you are providing a service to people that are making money (or at least transacting their business...) off this software.

IMHO: Any kind of public domain or copylefted software used for amateur purposes is OK to transfer over amateur radio.

Is anyone operating dual frequency, full duplex packet nodes on 2 meters on frequencies other than coordinatable/bandplan repeater pairs? How about 145.01/145.61? How do you interpret the fcc rules on this one? 145.61 is in an area where repeaters are supposedly not permitted but is a full duplex packet node a repeater as we have come to know repeaters? The ARRL Repeater Directory says that the frequencies between 145.5 and I believe 145.8 are bandplanned for experimental modes. Everything in this developing mode of packet radio is experimental isn't it?

Please let me know what you think.... We need some full duplex packet systems and standard repeater pairs have all been used for voice repeaters whether they are really needed or not.

You might try doing some unusual splits in the repeaters. The FCC rules do NOT allow repeaters in the 145.5-146 Mhz range (nor 144.0-144.5) so you need to limit yourself to 144.5-145.5 and 146-148.

It is a sad shame that spectrum planners and repeater coordinators are not making any attempt to plan for greater density of spectrum usage. They simply assume that when there is no repeater pair that comes up without a conflict on the computer, that that band is full at that location.

Spectrum planners need to get on the ball and do some planning. If that calls for some repeater pairs to be dedicated to packet, so be it. It may not be necessary to do that.

However I must assert one thing for certain: just because someone has had a repeater on a given frequency already is no reason for having a "right" to stay there. If packet radio needs to share the spectrum of repeater pairs then the spectrum should be allocated as needed.

This probably means some repeaters will have to move. Hey folks, that is part of progress. Of course some hams are totally against progress, and the only solution I can suggest for them is to take them off the air.

By the way, you CAN get several TIMES the number of repeaters on the air in the major cities as you have now. It also appears that the number of repeaters in several are NOT EVEN NEEDED. The situation as it exists now is mostly turf claims. This has to end and spectrum planners and repeater coordinators need to get off their hind ends and do something.

Problems will always exist when those who coordinate are also there to protect the turf of existing repeater owners.

I a big city you can hit 20 to 40 repeaters easily. Tell me how many of them are actually IN USE most of the time? What is the average amount of airtime per repeater per day? I think you will find things are NOT as dense as we might like to think.

I agree 100% with Phil on the problem of repeaters and the need for ending
the *turf* battles that are occurring over frequency *rights*. But, I think
the REAL solution if you want *full duplex* is individual, not-necessarily-
600 Khz-offset frequencies. put one in the 145 simplex area, the other in
146. Yes, I know *FM simplex* is what it says. If the natives are restless
about such *sins*, cross-band. This saves on duplexor costs. You can buy
a good quality radio for less than what it will cost you for a good set of
band pass/band reject duplexors. Then run real full duplex.

On second thought, go up in frequency and run FAST, full duplex.

I'm sorry that I can't quote chapter and verse, Phil, but I don't have
my personal copy of the new Part 97 yet. My comment stems from a GRAPES
session a few months ago when we were reviewing the rewrite. As I recall,
the new language puts both a baudrate and a bps limit on everthing below
440. I'm going to be in a ham store tomorrow, so I'll pick up my
own copy of Part 97 and find the clause. Meanwhile, you might want
to reread the digital sections carefully. It was the consensus of every-
body that read those paragraphs that day that 56k was out on 220.

I think you're referring to a typo in the rules rewrite that did indeed
move the limit for wideband packet up to 420 MHz. This was not the intention
of the FCC, and in fact it was fixed in an errata ruling.

Moved from urban area in Pittsburgh, PA (plenty of stations) to Milford, OH (near Cincinnati, OH) and I'm having more difficulty contacting stations. I can hear W8YS and KY8T (sp?) in PASSALL mode (I would expect errors, Lebanon OH (home of W8YS) is 30 miles away, I don't know where the other station is.)

Does anyone know how the Cincinnati WAN is organized? Where else should I look besides 145.0{1,3}.

I'm ready to break out my 10M rig and go HF.

Thanks.

I posted a query a few days ago about a space shuttle flight on which a ham op
woold be using 2-way packet communications. I received no answers (possibly
because the internet address in my .sig was dead...) So I will ask again, and
add what little I do know, taken from May 1990 QST.

Quote:
The Shuttle Amateur Radio Experiment #2 (SAREX-2) packet radio station recently
underwent testing at the Marshall Space Flight Center in Huntsville, Alabama,
with assistance from area hams.
        The packet radio station flying on space shuttle mission STS-35 will
give each amateur who connects to WA4SIR a QSO number confirming the contact.
More than 550 teachers, parents, and Amateur Radio clubs assisting schools have
contacted the ARRL Educational Activities Department for details on making a
contact with the shuttle crew. This is a great opportunity for showing the excit
excitment of Amateur Radio to our youth! QSL cards will be available.
        The FCC has granted Payload Specialist Ron Parise, WA4SIR, a waiver to

use his call sign for a space station aboard STS-35 to be launched May 9, 1990. Teachers can obtain shuttle locators from the ARRL Educational Activities Department by sending a 9- x 12-inch envelope with 45 cents postage affixed.
End Quote.

Questions!:
 What frequency! What frequency! What frequency!?
 Can *I* contact this guy using my silly antenna made out of coathangers and 5 watts of power on VHF?
 How do I know when the shuttle is audible? (I know -- listen for it. I mean how do I predict?)
 What frequency?!

I am not a parent, teacher, or club, and (besides) I doubt I'd get any meaningful info from the ARRL before the 9th anyway. All help appreciated.

Minor brainstorm:

To get a synchronous serial port for packet, why not retrofit a Zilog SCC to fit into an 8250 UART socket?

Why bother? Low cost: serial cards are a dime a dozen. I'd guess that with a little scrounging and some not-too-difficult modification work, you could end up with a dual port (or maybe even a four port: 2 SCCs) card for about $30. Plug in a cheap '3105 based 1200 baud modem and/or your latest 56kb toy, hack a driver for Phil's TCP/IP, and off you go!

Anyone care to comment on this? I've got the specs on the SCC and the 8250 datasheets are on order. From what I can remember about the 8250, it doesn't look that difficult: just a matter of swizling the pins around.

>worked pretty well for the voice FM repeater crowd.

There are two main problems I can see with polling schemes on packet radio. The first is one common to all polling schemes: the overhead required in polling a lot of stations when only a few of them have any traffic. To get good performance in this situation you need to set up algorithms for dynamically inserting and removing stations from the poll list, and these can get very complex.

The second drawback is that the master station has to have a solid RF path to every station that it polls. This may not always be practical on a simplex channel. If you use a repeater you don't have this problem, but then you might as well use CSMA/CD.

The one place where polling might make sense is if you build the repeater, are unable to implement CD at the user nodes, and you invoke the polling technique only when the traffic load goes above some threshold. Below the threshold stations simply contend randomly for the channel; when things get busy you start polling. But the algorithms to do this are decidedly non-trivial.

You can get a PC-compatable wirewrap breadboard card for about $20, and it already has complete address decoding and bus buffering on it. (JDR Microdevices and elsewhere.)

To add a pair of SCCs to this is really trivial.

One $6 monolithic oscillator, a little bit of TTL glue, some RS232 level shifters for the ports that need it, and you've got it. Real cheap.

I'm not precisely familiar with the N/R approach, but clearly for any kind of reasonable performance with the data rates involved, you'll want to build a widget that provides a CTS or similar input to hardware flow control the TX line on each PC, so they don't mash each other on the wire. The serial port code in NET/NOS as shipped does not use any kind of hardware flow control in any form, though the folks in Japan have tweaked a version to do incoming flow control, and report it wasn't a very big change to Phil's driver.

Either PE1CHL or PA0GRI told me about a board that had been fashioned in Holland to drive the CTS or whatever line on N/R-equipped TNC's in a round-robin fashion to allow more equal sharing of TX time between the TNC's, and to help eliminate this collision problem, but I confess I don't recall the exact details... maybe one of them or their friends will hop in and tell us the specifics...

>what you described is exactly how some satellite uplinks for mobile
>stations are working to avoid collisions.

Satellites are a special case because of the long propagation delay. CSMA/CD

falls apart very rapidly as propagation delay is increased, because everybody "sees" the channel as it was a quarter of a second ago, and anything they do won't be seen by the other stations for another quarter of a second.

>And if the 'poll' is encapsulated inside of the regular
>frame this principle would not even avoid additional overhead it will
>avoid some empty ACK frames which would have to be sent otherwise.

You still have the problem of either spending time polling stations who don't have any traffic, or allowing those who do have traffic to contend for the channel (and possibly colliding).

>Some nice description about this could be found in
>
>   IEEE journal on selected areas on communication
>
>of the preveous years.

Another good reference is Tanenbaum's "Computer Networks".

>A full-duplex channel does not avoid collisions, it just reduces them
>somewhat.

True, but even "reduces somewhat" can make all the difference in the world. Ethernet is a good example -- it is very stable even under pathological overload because of the collision detection feature combined with backoff.

>Transposing APPLE's localtalk to PR could help a little bit but doesn't
>solve the problem in general. Because no station can make shure to
>get it's RTS frame through and no CTS sending station can make shure
>to stop ALL other stations if some are hidden related to the CTS sending
>station. Only a master station up on a hill has a chance to be heard by
>all others.

You are correct that collisions between RTS frames can happen, but remember that these are (ideally) much smaller than the data frames, so the damage (in terms of lost channel capacity) isn't as great. It's like Ethernet: collisions can occur only during a relatively small window compared to the total data packet duration. But CTS packets have a nice property in this system: if you can hear one, then chances are that the sender of the CTS could hear you as well, and you should stay off the channel for the appropriate interval. But if you *don't* hear the CTS, then it's probably okay for you to transmit since he probably won't hear you anyway. This scheme is essentially a time-domain analog to the Busy Tone Multiple Access (BTMA) scheme. Of course, if you're going to do automatic power control on each packet, then you've got to be more careful.

As for compatibility with AX.25, I see no need to change the AX.25 frame format. You'd do everything "on top" of the existing frame structure. Of course, the link control procedures are different so you'd want to establish a separate channel that would be limited to those agreeing to use the new procedures. But I'm willing to write the code...

| At the risk of Flames, another alternative is to have a master station,
| and *poll*. I know this imposes the requirement of a master (build
| two if your worried about single point of failure), but masters have
| worked pretty well for the voice FM repeater crowd.
|

| Consider construction of a cell of users (this scales nicely, in either
| direction) that have a master. The master polls each member of the
| cell. The master would also have links (preferrably pt-pt) going to
| other cells. This way, a master could be moving traffic in and out
| of a cell duplexed with intra-cell traffic.
+---------------

This is *exactly* the architecture we finally came around to for Xerox/XTEN.
(Remember them? Late 1970's? Proposed nation-wide digital common carrier based
on a 10.6 GHz cellular system for local distribution? 256 Kb/s data rate.)
After looking at lots of fancy protocols for the local cell's multi-access
control, things like "Reservation TDMA with a slotted-Aloha reservation
channel", we decided to use simple polling (with a variable-rate polling
schedule depending on recent station traffic history). But this was made
easy by the fact that the outgoing broadcast channel from the cell was on
all the time, so polling info could be slipped into the output data stream
at almost no cost.

Do the FCC regs permit a full-duplex repeater to key-down "forever"?
If so, there's also another ancient method that could be used here, called
Busy-Tone Multiple Access (BTMA), which is just a form of CSMA using a
sidetone or sub-carrier back out from the repeater to indicate incoming
carrier detect at the repeater. The win here is that you can be streaming
useful data out from the "repeater" (o.k., a full-duplex "bridge") while
you are doing the CSMA resolution.

There's a *lot* of ancient packet-radio access-protocol technology from the
late 60's and the 70's (mostly from DARPA reports) that probably could be
usefully dusted off and applied [with updates and file-to-fit] to modern
amateur packet. The whole issue of the hidden-transmitter problem was studied
to death back then. Sounds like it's time to do some literature searches...

>Does anyone have details on how to daisy-chain RS-232 ports?

A simple approach to connect several RS232s together is described in
the doc of TheNet. It uses some diodes crosswired between all Ports.
Up to (about) 5 ports may be connected together in this fashion.
The manual is available on several servers.

A more sophisticated solution was designed at the NORD><LINK group
by DG9FU about 1 1/2 year ago. This version utilized a ring counter
which enabled / disabled all connected ports (via CTS pin). Two (?)
prototypes have been working and this idea was catched by pa0apa.
So he redesigned the circuitry by replacing some CMOSs by a FPLA
and designed a PC-board around it.
This idea was given up meanwhile because every enable/disable cycle
for a nonrequesting TNC produces 2 interrupts in the firmware. This
produced a lot of additional load to the TNC's CPU if the
auto-enable feature of the interface is not used.

So I developed another circuitry that avoids all of these problems.
There are no unneccessary 'polls' to the TNCs. So there is no additional
interrupt load for the CPU (unfortunatly the TNC's SIO may only be
operated in software enable/disable mode in the required context).
The circuit operates in a way of channel interlock which allways grants
exclusiv bus access and avoids collisions. A kind OM around here offered
to produce some pc boards of this circuit. But I haven't got any input
of him since quite a long time (I hope he's still alive).

But meanwhile there's a 4th version en vogue here. It is utilized in
the newest development of NORD><LINK's TheNetNode. All RS232s are
connected in serial, which means every TXD is connected to the next
RXD etc. Access is handled in a way of a TOKEN RING. This avoids
internal collisions by it's nature. But it requires TOKEN RING
support in the software of all connected TNCs or PCs (of course).

Detlef (dk4eg)

        I've got some docs here on hooking Net/Rom nodes back to back. It
lists a product called a ".. TJP Octopus which is a diode matrix board that
allows up to 8 TNCs to be tied together with minimum hassle. The board is
available from
        John Painter
        7 Jefferson Street
        Nashua, NY 03060

        for $15. Information on the board may be gotten for a S.A.S.E at the
same address."

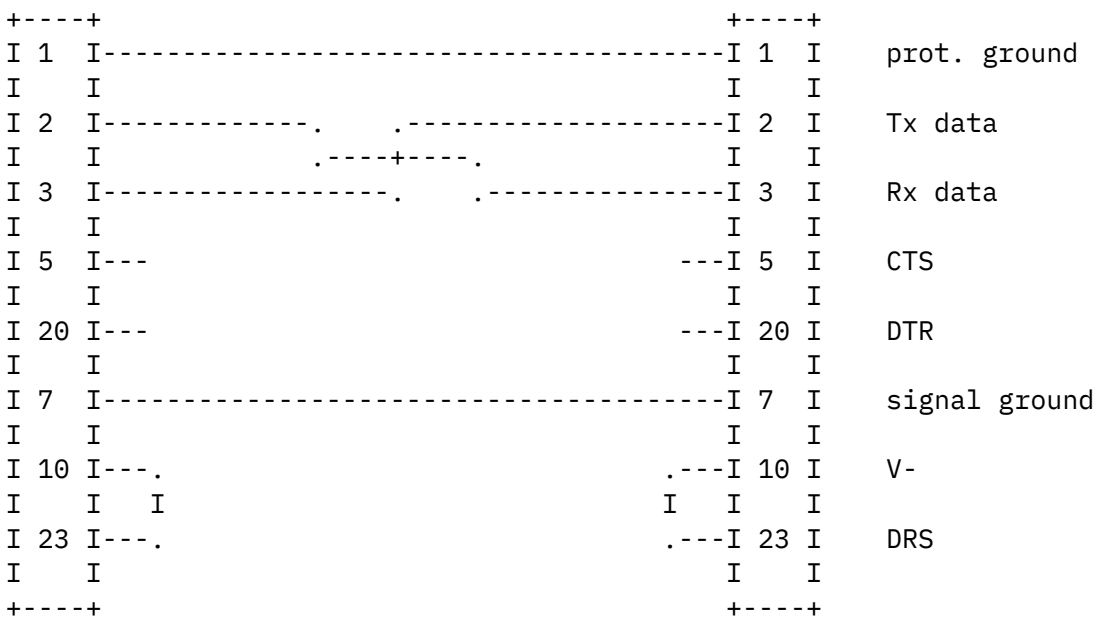
        I have neither used nor seen the card.

        Digging through the TheNET DOCUMENTATION, I found the following
diagrams which may be of use:

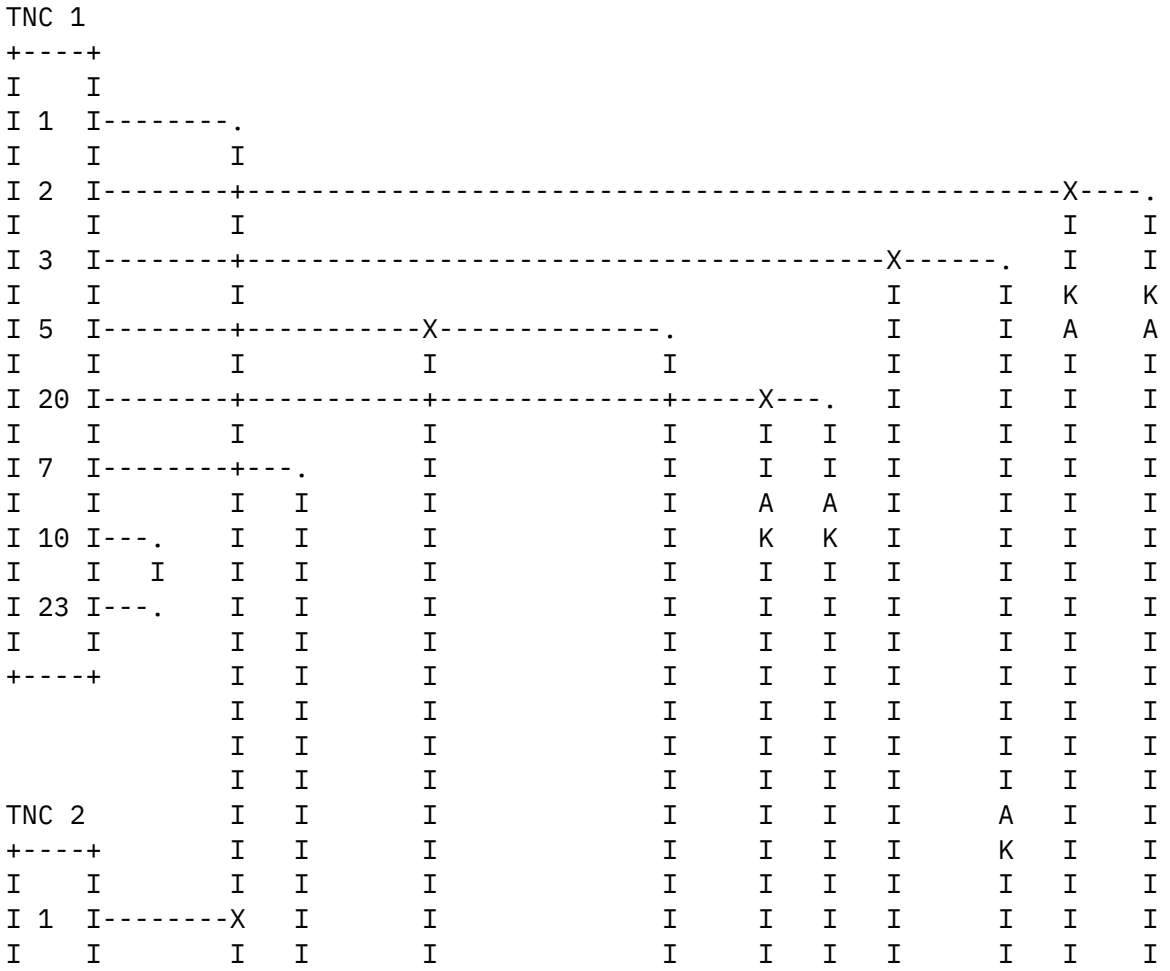
***** Start of excerpt *****

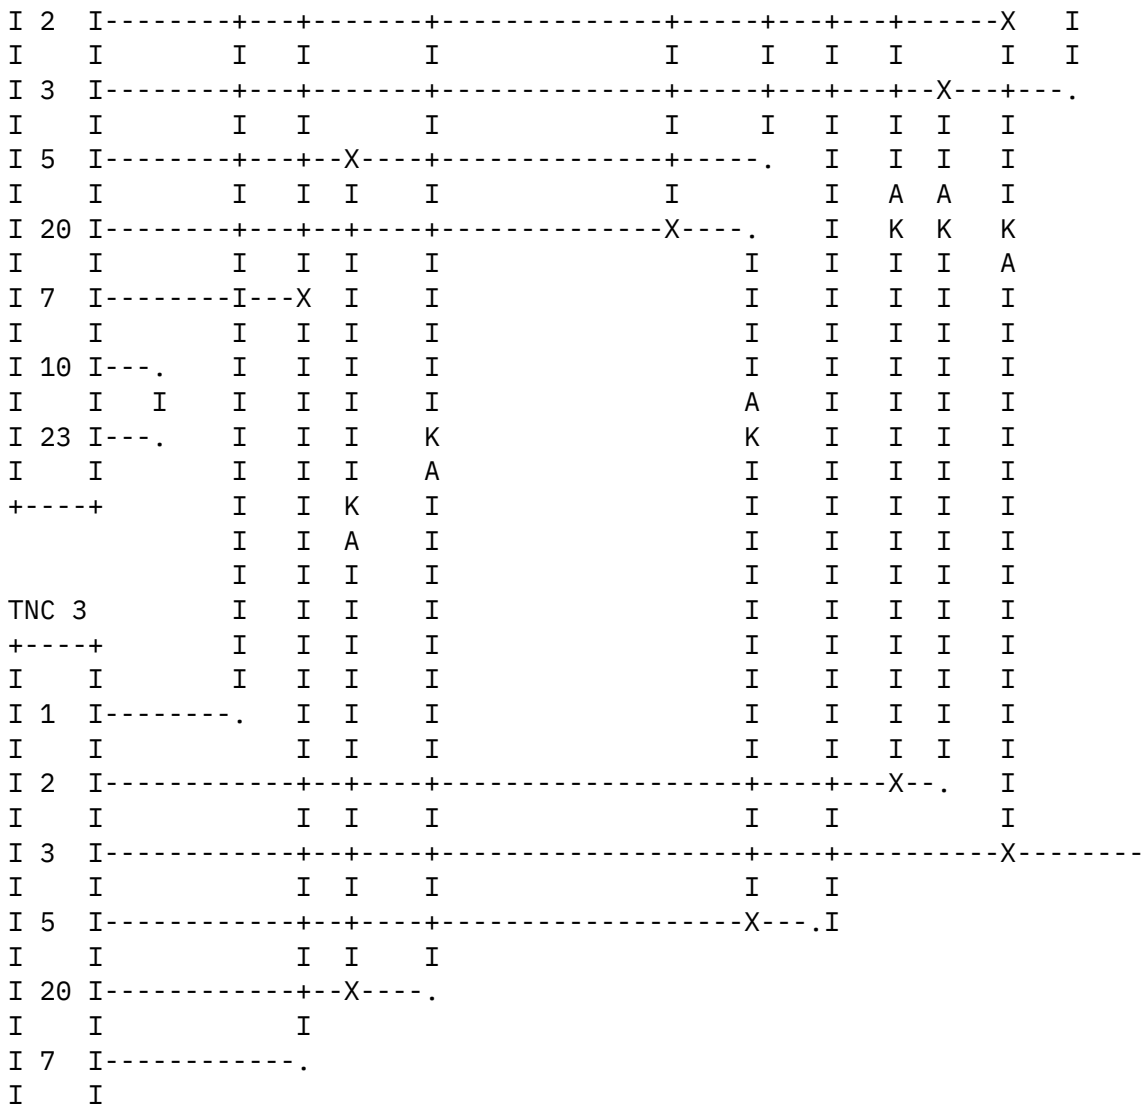
              Connector Cable for 2 TNCs Interlink Operation

TNC 1   TNC 2   signal



Connector Cable for 3 TNCs Interlink Operation





***** End of excerpt

Looking at the diagram for the 3-node interconnect I notice that they are using CTS and DTR (pins 5 & 20). From the way they are interconnected, I'd guess that these lines are used for a activity indicator, much in the same way the Carrier Detect is used on the air.

I do not know if the SLIP code does this as well, so you may be at the mercy of probability: a node has no way to check if the serial line is already in use before transmitting.

Comments?

     Can anyone make a comment on how TNC-1s are organized, in
     particular the following information: (assume Heath HD-4040)

     1)   Which parts of the memory map are used by the TNC,
          What is the hard-reset start address, and where do

the code sections fall within the ROM? There is a C000 8K prom and an E000 8K prom ... what parts of the code fall where? Thanks ....

2) Can anyone tell me where I can get full documentation on Ronald Raikes WA8DED proms, version 1.0? And whether they will work with the TNC1.HEX file off of the SIMTEL20.ARPA::PD3:<MISC.KA9Q-TCPIP>TNC1.HEX ???? More thanks ....

3) Can anyone tell me why the TNC1*.ASM files from the TNC_TNC1.ARC files on SIMTEL20.ARPA don't compile? I tried to assemble them using Motorola's Standard Field Development Assembler, AS9 for the 6809, and it choked on two unknown opcodes: TAB and CLI.

4) And finally, can anyone tell me if there is a pin-equivalent EEPROM (Electrically-Erasable PROM) for the 2764 EPROM?

What happens is is that my TNC doesn't work with the new proms, not with all the reccomendations I have gotten. I am trying to think of every possible problem. If you have any ideas, drop me a line! Just about all comments are helpful. (except for the "get a new TNC!" type).

Also, does anyone have a TNC with the standard Heath Proms, and could send me a HEX file of the image? Or is that a copyright violation? I bought my TNC used with the WA8DED proms.

THANKS FOR ALL YOUR HELP!!!

This sort of "treatment" is the norm, and you may take it to be abusive
or derisive only if you choose to. By this time, most Usenet-ers understand
that it is unrealistic to demand a well-phrased, erudite, and mannerly
response to their questions. Nor do they have any reason to expect them.
(I am referring to the general case, and am not making a judgement call
on any of the responses related to this posting.) Since most respondents
have limited time and are able only to pass on a terse message in
answer, one should not read any more into them than what is there.

When someone posts a question on the Usenet, he/she expects information
in return. If editorial opinions happen to be included with the response,
most individuals are familiar enough with grammar and meaning to separate
them out and discard them if appropriate.

Finally, even if a poster does receive derisive responses to a question,
it is no reason to abandon the pursuit of the original goal. To do so
would be prideful and counterproductive. When such things happen to me,
I take what information I did get, and go back to work on my project
without any further communication with my antagonists.

>This is no fun anymore.

That's regrettable. So find what IS fun to you, and pursue it.

Things are better for the packet station. As it turned out, the programmer I had did not understand Motorola S-Records starting at address F800 in a PROM that addresses 0000 - 1FFF. I guess from TNC_TNC1.ARC what was expected was that one downloads the S-Record format. Anyway, I burned the KISS image in TNC1.HEX and VOILA, it worked!!

One other tiny request ... could someone give me some IP addresses in the Central Massachusetts area that I can talk to on 2 meters? The closer to Worcester the better ... and THANKS A MILLION YOU ALL!!

The TJP octopus works quite well...I've seen several of them, and ALL of the sites on the North East Digital Association network use them...it contains room for eight TNC's, comes as a kit, and is very neatly laid out.

NEDA, for those who may not know, is VERY large, covering probably three fourths of New York State, and with arms reaching deeply into

New England, and growing every day. I am REALLY curious about what other sizeable net/rom networks are out there, and if there are any such umbrella organizations as NEDA or if it's just chaos.

This needs some more comment:

I don't believe it is possible to fit NET or NOS as it currently functions into a slow machine with only 8 bits and 64k of address space without incredible contortions such as overlays and a major gutting of its functionality. Even if it were possible, I don't see how this can in any way be called innovation.

If someone wants to TRY, I can only shake my head in wonderment and offer them encouragement, whilst counseling that beating a dead horse offers little reward. ("Have fun storming the castle!")

I can see a place for a stripped-down version of NOS (just rip out the kitchen sink and all the other ornamental clap-trap) that would be a stupid IP router that you could stick in a Xerox 820 or other similar small-brain machine. That would make a nifty little mountaintop router.

But the economics of the marketplace still apply: just because I happen to have three of the damn Ferguson/Xerox Z80 CP/M machines sitting in my garage doesn't make it a good platform for developing ANYTHING for the ham radio network. Too many replications of the finished product

will be needed to form the network for the use of ANYTHING that can't
be bought or made cheaply to be a good choice.

This replicability is the reason that the IBM-PClone was chosen for NOS
development. In today's computer marketplace there isn't ANY OTHER
choice for ham equipment that can even come close to being as available
as are the pieces for building PClones.

We are NOT talking (or yelling, as the case may be) about the
onesie-twosie home station; what I'm talking about is the dedicated
AMPRNet network nodes. Either they're going to be a custom-built device
that offers overwhelming performance or else it ought to be something
we can buy for really cheap in whatever numbers are required.

In summary (for this has gone on for far too long), if you are just
interested in doing something for yourself, far be it from me to try to
dissuade you (except to opine that you are wasting your time), but
those of us with a large scope of goals really think we have better
things to do.

Love and kisses,
     - Brian

   You can get a PC-compatable wirewrap breadboard card for about $20, and
   it already has complete address decoding and bus buffering on it. (JDR
   Microdevices and elsewhere.)

   To add a pair of SCCs to this is really trivial.

   One $6 monolithic oscillator, a little bit of TTL glue, some RS232 level
   shifters for the ports that need it, and you've got it. Real cheap.
        - Brian

I have designed just such a board for a digital repeater project. I
can send postscript or orcad schematics and PAL equations to anyone
who asks. This is supposed to be an "Eagle" compatible board, at
least as far as the driver for NET is concerned. Email me at one of
the address below or FTP 'em from n1dxg.ampr.org if you are local.

Back in 1981 or 1982 there was an article in Byte magazine about hooking
several microcomputers together with serial ports. A couple of simple

circuits were shown, and the software necessary to implement a simple
network was described. It was called ULCNET (Ultra Low Cost NETwork).

I don't know what it would take to convert the SLIP driver to use this,
but thought it might at least give you some ideas.

The magazines are at home, but I'm almost sure it was in an October issue,
either from 1981 or 1982. I can find out for sure if you can't find it and
are interested.

Get a copy of 8th ARRL data conference proceedings. Read the article of
a four channel IBMPC board with 2 * 8530's. The output is opto isolated current
loop. The output signals of each channel are RXD, TXD, RTS, DCD. There is also
a cheap external TCM3105 based modem. The all the schematics are included.
When you want more channels, you can use more boards on the same interrupt!

I have printed circuit boards of the IBMPC board (~$20), 1200 baud modem (~$3)
and also components. After a long beta test period, the distribution in the
Netherlands started a few weeks ago. I haven't started with the delivery to

the sign up list from the conference.

The driver is already in NOS and in PE1CHL's version of NET.

John Whitson (jwhitson@wpi.wpi.edu) asks about " WA8DED Proms and TNC1s in general"

John, you asked 4 questions and I have 1.5 answers for you :-) I used the WA8DED code in a TNC-1 but it was a long time ago. However, the 6809 will always remain a fond memory and I still faintly remember some of its specifics.

> Can anyone make a comment on how TNC-1s are organized, in
> particular the following information: (assume Heath HD-4040)

> 1) Which parts of the memory map are used by the TNC,
> What is the hard-reset start address, and where do
> the code sections fall within the ROM? There is a
> C000 8K prom and an E000 8K prom ... what parts of
> the code fall where? Thanks ....

This is the "half an answer". The 6909's reset vector is at $FFFE - $FFFF. Obviously, it'll lie at the very top of the E000 8K EPROM. It points to the startup code and other vectors (NMI, IRQ, etc.) are at $FFF2 through $FFFC. Some of them also point to code. But I can't be less vague about how the code is organized; sorry.

> 3) Can anyone tell me why the TNC1*.ASM files from the
> TNC_TNC1.ARC files on SIMTEL20.ARPA don't compile? I
> tried to assemble them using Motorola's Standard
> Field Development Assembler, AS9 for the 6809, and it
> choked on two unknown opcodes: TAB and CLI.

TAB and CLI are 6800 mnemonics and don't exist in the 6809. "Real" 6809 code wouldn't use them, of course. But they're convenient and many 6809 assemblers allow their use and convert them to the applicable 6809 instructions, either in a "hard wired" fashion or by use of macros. You can get the same effect if you substitute ANDCC #$EF for CLI (Clear Interrupt Mask) and TFR A,B for TAB (transfer A to B). There are a whole slew of other 6800 mnemonics that have 6809 "equivalents" too.

> 4) And finally, can anyone tell me if there is a pin-equivalent
> EEPROM (Electrically-Erasable PROM) for the 2764 EPROM?

The 2864 comes to mind, but I've never actually tried one.

When I had my TNC-1, I had both the 4 standard TAPR and 2 WA8DED EPROMs installed in a piggy-back fashion, with a toggle switch to select the CE (chip enable) lines on the appropriate EPROMs. Another set of contacts on the switch selected alternating banks of the NOVRAM. This allowed easy changing back and forth. I don't take credit for this configuration; KB7G told me about it.

Hope this helps. Good luck with it.

It's coming...that's one of the 3 projects that are going on here,
and it's just waiting for a _DECENT_ Z-80 cross-assembler/simulator.

>But the economics of the marketplace still apply
 ... stuff deleted

>We are NOT talking (or yelling, as the case may be) about the
>onesie-twosie home station; what I'm talking about is the dedicated
>AMPRNet network nodes.

Sure, you're right, but there should be some developement for the low-
end of things...after all, that's where most people are SUPPOSED to be.
A sun 3/50 running sunview wouldn't make a very good file server for
ten other machines; a file server wouldn't suit me very well on my
desk. Right now, we've got a bunch of fully-functioning pieces of
the network, and it's easy to say: "The network is just being born;
let's make as much of it 'complete' as we can _NOW_".

So, then, let's clarify something here that I've had on my mind for
some time: What's the difference between a "network node" and an
"end user" as it relates to IP? And just where are these "end users"?

I've always thought it would be neat to put an EPROM into a TNC2
(cheap, available, etc.) that would give you, say, FTP and TELNET,
or maybe even just TELNET, to let the unfortunate ax.25-only users
get into things from a dumb terminal. Keep in mind that there is
still a LOT of resistance to TCP/IP in some parts of the country,
for a variety of reasons. It behooves us to ease the masses into
things when we know that we _will not_ survive on our own.

>Love and kisses,

Back aways Techs mentioned multiple Z80 processors....
I wanted to know, how can you keep 2 z80 processors from fighting
on one S100 bus? any ideas?

About the NewComm program, its a small little thing, (under 2 k still) that
a fairly well featured comm program for its size. The only problem is that
you have to hack the code to christs grave and back to get it to work on
your machine because I wasnt think portability when I wrote it, just,
I Need a com program.

USENET MEETING PLACE AT DAYTON HAMVENTION

It's that time of year again! Year after year we see postings on
USENET asking, "Where can USENET radio afficinados get together for
an old fashioned eyeball at the Dayton Hamvention?"

In 1990 we have a place of our own.

Come to the Digital Suite on Friday, April 27 at the downtown Stouffers
Hotel, room 425. I have a large suite reserved for packet, RTTY, USENET
and Fidonet hams, so we can all get together and see what each other
looks like (scary!).

This is at Stouffers, where many of the DX clubs host the infamous
hospitality suites. . .where you can gab with famous DX and contest
hams until the wee hours. And now we have our own hospitality suite!

Show up after 8pm, room 425, downtown Stouffers in Dayton, April 27th.

BYOB and non-smoking, please.

See you there!

Dayton is getting closer. Here are the suggested frequencies whereby

rec.ham-radio and info-hams people can communicate. Of course there will be lots of QRM especially at the Hara Arena on 2 meters. Three frequencies are suggested just in case someone is stuck on one band.

        223.600
        445.600
        145.600

If you can get on 223.600, that should be the first place to try. Second will be 445.600, and finally if you must and can get through, go for 145.600. The first of these frequencies was suggested a while back and I added the UHF suggestion then. With this posting I am adding the 2 meter suggestion for those stuck on that band.

        PL 118.8 (2B)

If you can transmit a PL/CTCSS tone, I suggest everyone use 118.8 hz (2B). That way those of us who can do tone squelching can cut out some of the QRM. This will be especially useful for those who are stuck on 2 meters.

Outside of the Hara Arena, simplex might not hit everybody. Perhaps you can try all three bands depending on your capabilities. The fallback is to call on repeaters. I suggest the primary keyword to say and to listen for be "usenet". Others such as "rec ham radio", "fidonet", and "info hams" might work, but might also be a bit more misleading to others. Due to the low number of repeaters for the significan ham crowd in Dayton, suggesting a particular one would probably be futile.

A network node only needs to route packets so you can leave out all
the application protocols like smtp, telnet, ftp, etc. All you must
have is the link protocol and ip protocol handlers in a net node. A
user station on the other hand would be pretty useless without the
application protocols aboard. In practice we don't bother to strip
out the application protocols in our switches since we don't need
the extra free memory and it makes onsite debugging easier. However,
we do make sure that the servers for the mbox and such are left
disabled. It is very frustrating to find the switch down because
some "poor dumb users " have connected to the mbox and left connections
hanging to the point of exceeding max session. The mbox is no substitute
for a real lan bbs.

Where are the end users? At both ends of a session of course! -)
We have Unix boxes in people's homes, dos boxes in people's homes, and
a few crazys with laptops in their cars.

>
THIS IS A VERY BAD IDEA!!!
First, one of the most valuable things about tcp/ip is that part of
the network lives INSIDE your computer. This makes possible end-to-end
integrity of file transfers. If you attempt to put the protocol in
an external box, there is no way to guarantee that the data arrives
intact on the destination user's disk.
Second, the economics of dumb terminals is absurd. Like in the discussion
on porting the ka9q code back to cpm, PCs ARE CHEAPER THAN TERMINALS!

I got a blank PC board for the PC-100 for $25 from Paccomm, and the last
time I talked to the people at Paccomm, they had LOTS of boards around
unsold. The PC-100 is very similar to the DRSI, and has space for onboard
modems. This is more cost-effective than wire-wrapping something.

The distinction is more clear in the "real" Internet, where you usually have routers ("network nodes") that switch IP packets between networks, and hosts ("end users") that generate and consume IP packets. In Internet parlance, my host code has "imbedded gateway functionality", so a single machine can handle both functions. (BSD UNIX-based systems also have imbedded gateway functionality, even though most aren't used that way.) Anyway, it's up to you to decide whether you want to dedicate a set of machines to act as routers or if you prefer to have the user nodes share this function.

>I've always thought it would be neat to put an EPROM into a TNC2
>(cheap, available, etc.) that would give you, say, FTP and TELNET,
>or maybe even just TELNET, to let the unfortunate ax.25-only users
>get into things from a dumb terminal.

Telnet can already be used from a plain AX25 TNC by means of the SM0RGV "mailbox" module in NOS. One of the commands that Anders added a few months ago is a "gateway" feature that allows you to connect to the mailbox using straight AX.25 and then initiate a TELNET connection to an Internet host.

But "FTP on a TNC2" doesn't make much sense; how do you use a file transfer protocol on a system that doesn't have a file system?

> Keep in mind that there is
>still a LOT of resistance to TCP/IP in some parts of the country,
>for a variety of reasons. It behooves us to ease the masses into
>things when we know that we _will not_ survive on our own.

The real issue is a basic difference in network philosophies. The TNC is fundamentally designed to connect a "dumb terminal" to a packet network so it can talk to other dumb terminals; it is patterned after the X.25 "PAD" of the middle 1970s. (Even though most TNCs are probably now connected to host computers, the "dumb terminal model" still applies, unless the TNC is running in KISS mode.)

In contrast, TCP/IP is for COMPUTER (not terminal) networking. That is, it's designed to support computers instead of terminals at the end nodes. So TCP/IP has little to offer to the ham who doesn't have a personal computer in his shack. But as more and more hams get computers, they'll discover the advantages in networking them. That's when they'll get interested in TCP/IP.

Phil

Pardon me for posting a question that is only tangentially related to
packet radio, but I don't have access to Internet and can only get a
limited number of mailing lists.

Here is my problem. I have an HT, a power supply and a TNC. The
problem only involves the first two. I'm getting RF interference
problems when I transmit on high power (6 watts) off the power supply.
In fact, the HT just turns itself off. I have to cycle to power on
the power supply to restart. I have already added a counterpoise cut
to 1/4 wave for 146 MHz to the chassis of the power supply and I've
also wrapped the DC supply line from the power supply to the HT ten
turns around a pair of RF chokes that I got at radio shack. I live in
a third floor apartment, so a real "earth ground" in not feasible. In
fact, it seems as though the problem has gotten worse since Ive tried
these things.

Am I in danger of doing harm to my radio? What further steps can I
take to eliminate this problem?

advTHANKSance,

Marc

funny, but Norstar did this 10 years ago (or more) with there
Horizon, not with 2 Z80's, but with 4... i am not sure how they
got around it, but as i recall, it was thru the wonder of timesharing
the io... it has 4 seperate CPU baords in it, all sharing the io board,
each with 64k of memory for that processor... you might want to look
into how they handled it...

Later.

RFI in the power supply: Have you tried installing capacitors across the
power supply inputs, outputs, and to the metal case of the supply? Use 0.01uf
@ 1.4KV or higher on the powerline end of things. 0.01 @ 50v should be OK on
the 12v output. If that doesn't do it, try putting caps (0.01 @ 1kv) across

the rectifier diodes (if it's a switching power supply) on the 'hot' side.

Nothing critical about the value 0.01uf, any disk ceramic near that size
should be fine.

hope this helps WA2ISE

Say what?? Unless Usenet participants want to define themselves as a
lower life form, I see no reason why I shouldn't expect the same sort of
civilized conversation here as I would in person. It shows a lack of
respect for one's own ideas as well as for the reader when someone
doesn't take the time to communicate a message clearly. And I'd think
it takes extra effort to include unmannerly remarks, so it should be
easier to be civil. :-)

> Since most respondents
>have limited time and are able only to pass on a terse message in
>answer, one should not read any more into them than what is there.

Does this imply that the hundreds of people who *read* the posting
don't have limited time? Why should they have to spend extra time
decoding the meaning of the posting because the writer didn't take
an extra couple of minutes to be clear?

I know, for instance, that Phil Karn averages over a hundred incoming
email messages a day; then add all the newsgroup messages he reads.
Yet I've seen him spend ten minutes on a reply that someone else might

dash off in one, just to make sure that he's expressing himself clearly
and accurately.

Phil is just one example; I'm sure that many other people on the net
are similarly conscientious. They're the ones whose opinions I give
credence to. I've had to give up reading postings by some people who
might have some decent ideas simply because I couldn't find the good
idea buried in all the sloppy writing.

Anyway....followups should probably go elsewhere; pick a suitable
newsgroup and go for it.

Patty

Hmmm. This makes me wonder if RTS/CTS frames are *really* going to be that
much smaller than data frames in an interactive environment. For file
transfer, yes... but... comments?

There has been some discussion about BTMA (Busy-Tone Multi-Access)
packet systems here on the net and so I thought I'd throw my two-cents in!

The Radio Amateur Telecommunications Society has been using with this type of access for its backbone using a single 440 MHz voice-grade machine with good results. The purpose of this system is to provide connectivity for some of the ROSE X.25 Switches in the OSI-type packet network operated by RATS here in the NY/NJ/CT/PA/DE region.

We have installed a receiver and transmitter at a high site accessable from anywhere within about 100 miles (minimum) of New York City. The controller is a TNC-2 that runs the digital regenerator software. The controller "listens" for packets and sends out a busy tone (HDLC Flags) on the output to inhibit other stations. As valid frames are received, they start out the trasnmitter FIFO-style with a one frame delay.

The code will be enhanced in the future to include general polling and "recent/most active user" polling algorithms as experience dictates.

The Xanthus Regenerator Code can be purchased for a small fee from:

It's not clear from your description whether the power supply is shutting down or whether the HT is dying. (Remember that the pilot light in most supplies just tells you that the power switch is on, not

whether you have any output from the supply or not.)

If it's the supply that's shutting down, you probably have RF getting into the regulator circuit and you need to add a bunch of bypass capacitors to the AC input and DC output connections. .001 uF 1 KV disk ceramic capacitors are a good way to start, and they're quite cheap. (The value isn't critical; anything from .001 to .01 ought to work just fine.)

Put them from each side of the input and output to chassis ground in the supply; that means you'll need four of them (three if the negative supply output is grounded already). Or get someone to do it for you if you doubt your technical skill.

If it's the HT that's dying, you need to use some test equipment and see if the power supply is holding the proper voltage when you key up. Again, bypassing is probably the answer.
     - Brian

P.S. I mailed you a response to this, but we couldn't find a route to your posting site. Apparently it's not in the uucp maps, which your system administrator should remedy.

Check the current rating of the power supply. It sounds like you may be drawing more that it has and causing it to shut down!

Thanks, but the power supply is rated at 5 amps continuous and 7 amps
intermittent. The HT draws 1.9 amps on high power and the TNC draws
0.9 amps. Thanks anyway...

Regarding RFI in power supplies: don't overlook the power cord. I've found
that much RFI gets into (and out of) equipment this way, and it's actually
quite easy to stop. At almost every hamfest I've attended over the past five
years I've found people selling surplus AC power line filters made by
Corcom, Delta, CDE, Potter, etc. They seldom cost more than $5, and they can
work wonders. Because they are constructed in sealed metal boxes, they have
much better isolation than most filters made from discrete components.

It's best to put them inside your equipment if you have the room. If your
equipment uses an IEC standard power connector (like those used on IBM PCs

and clones) an excellent approach is to replace it with an integrated RFI filter/IEC connector. Not only is this usually the easiest approach, but you get the benefit of blocking the RFI right at the point where it enters (or exits) the equipment cabinet.

In general, the lower an RFI filter's current rating and the larger it is physically, the better the RF attenuation will be. So use the largest filter you can fit into the available space, and don't use a 20 amp unit for a 1 amp load if a lesser-rated unit is available. (Obviously, the unit must be rated to carry the actual load!)

Every time I buy a PC clone, I immediately install a power line filter inside the power supply. It really does make a difference, especially on the AM broadcast band.

In article <18330016@col.hp.com> bdale@col.hp.com (Bdale Garbee) writes:
>Hmmm. This makes me wonder if RTS/CTS frames are *really* going to be that
>much smaller than data frames in an interactive environment. For file
>transfer, yes... but... comments?

It depends, of course, on how large the data frames are. Small interactive packets are always less efficient to handle in a contention environment than large packets, but then the large packets usually account for the bulk of the load (and the overload) on such networks.

I think my scheme could support an optional "unguaranteed" data frame. It would be sent without the RTS/CTS handshake, but the transmitter would still be obliged to defer to RTS and CTS packets it hears from other stations. If you use this feature to send character-at-a-time TELNET packets, then any lost data will automatically be retransmitted along with subsequent data without too much extra overhead since the headers dominate anyway. At some

point, of course, the link could switch back to handshake mode if things just aren't getting through. The choice could be made by the link driver itself (by looking at the size of the link transmit queue in bytes) or controlled by TCP/IP by setting the "reliability" type-of-service bit after some number of unsuccessful retries.

Of course, one could always ban character-at-a-time TELNET...

I've also been analyzing the power-controlled variant of my scheme. It should work as long as CTS packets are always sent at full power, which must be the same for all stations. This is necessary to ensure that everyone within radio range of a given receiver is made aware that it is about to receive something. RTS packets could be sent at a power level appropriate for the intended receiver, or at full power if this level is unknown.

Whenever you overhear a RTS or CTS frame not addressed to you, you set a temporary limit on your own transmitter power. The level and duration of the limit is chosen according to the sender of the RTS or CTS frame such that you can't clobber that station's receiver when it listens for a response (either a CTS or data frame). If the amount of power needed to reach the sender of the RTS or CTS frame is unknown, then the power limit is set at zero. You are free to send any traffic you may have during another station's transfer as long as the power required doesn't exceed whatever limit is in effect. (Note that this may inhibit you from sending CTS frames, since they are always sent at full power.)

The power limit is lifted after allowing enough time for an RTS frame to be answered with a CTS, or for a CTS to be answered with the specified amount of data. Note that hearing a data frame does NOT inhibit your transmitter in any way -- the preceeding CTS frame should have already set whatever power limitation is appropriate to keep you from clobbering its intended recepient. This is how you can solve the "exposed terminal" problem frequently encountered by hilltop digipeaters.

The more I think about this scheme, the more I think it may actually work.

    I disagree completely. See below.

>First, one of the most valuable things about tcp/ip is that part of
>the network lives INSIDE your computer. This makes possible end-to-end
>integrity of file transfers. If you attempt to put the protocol in
>an external box, there is no way to guarantee that the data arrives
>intact on the destination user's disk.

    True, but not really applicable. Point-to-point NON-network
protocols exist that handle file transfers with integrity just fine: Kermit,
XMODEM, and even an AX.25 text stream.

>Second, the economics of dumb terminals is absurd. Like in the discussion
>on porting the ka9q code back to cpm, PCs ARE CHEAPER THAN TERMINALS!

Not true. Get near any university or large computer company and terminals are a dime a dozen. I've seen good Z-19s w/ modems for $50. Or, go to a yardsale and pick up a Commodore 64.

Most of the above points are minor ones, but they collectively raised some feelings that have been stewing inside of me for a long time:

First and foremost, plain old AX.25 text streams will be with us for a long, long time. Its the lowest common denominator for just about all of amateur packet radio. It is also the simplest packet "mode" to understand: just "CONNECT" and off you go. Given these two facts, I claim that plain old AX.25 text streams are and will continue to be the most popular "mode".

Second, it has been claimed that, in general, more equipment is required to run TCP/IP over plain old AX.25 text streams (hereafter "POATS"). While this may be true, I do not believe that it is an inhibiting factor for people running TCP/IP.

Instead, I claim that the main inhibiting factor for TCP/IP is ignorance. People avoid what they don't understand. Relatively few people have seen TCP/IP running, and even those that have can be in the dark. I've talked to people on packet that they want to replace AX.25 with TCP/IP for increased throughput on file transfers. I quickly explained how IP packets were shoved over AX.25 links, and how TCP and IP added overhead to each packet.

Also, in supposrt of this point, compare the implementation of Net/Rom to TCP/IP. Unlike TCP/IP, few people have network nodes in their house. Rather, Net/Rom nodes are erected for public use, with POATS up and downlinks. Because of this, the general knowledge of Net/Rom (and other networks configured in the same way: ROSE & TexNet) by average users is much greater than the knowledge of TCP/IP.

Finally, (and sadly), politics is a major problem in packet radio networking. You have the TCP/IP, Net/Rom, ROSE, TexNet, DX Cluster, and POATS camps. The less each knows about the other, the more "racist" the politics problem becomes.

In light of the above observations, I think the networks should be designed with the lowest common denominator in mind: POATS. Sure, having the network terminate at the user is better for various reasons ("file transfer integrity..."), but I think that's a luxury that some can afford (and understand) and some can't. I wish I had a Sun or VAX in the basement with a dedicated line, but I don't and Kermit and XMODEM work just fine.

I like the direction the NOS MBOX is going in. A POATS user can connect and play around with TCP/IP, just like is currently done with Net/Rom. He/she can observe: "Hey! I get pretty reliable connections with this TELNET thing..." or "The mail here seems a lot more reliable.." I think all MBOXes SHOULD be enabled.

*** Flame on

I get incensed at people who claim (and it has been done) that

I ham somehow inferior because I'm not running TCP/IP. When I explain to them that I'm running a software TNC with a modem hanging off my parallel port and that I wrote the software myself because I originally couldn't afford a TNC, they back off. I think TCP/IP offers the best networking currently available, and I'll get into it when I get the time and means.

There is a lot of exciting work being done on the "front line" of packet radio with high-speed modems, networking, etc. However, the "rear guard" of people running Digicom>64, my program, or some other POATS seem neglected. I argue that they MUST NOT be neglected, because it is their demand that ultimately drives packet radio development.

Case in point: the NEDA network in New England. This large network was not driven by technology (they are using TheNET nodes with TNCs connected back to back), but by POATS user DEMAND. Pure and simple.

I'm working on a very long range proposal to cut NEDA over to TCP/IP. However, the current configuration would be maintained: POATS up and down links, with TCP/IP (instead of Net/Rom) between network nodes. Such a scheme offers the most benefit to the most users. You could, of course, run TCP/IP from your house, but it shouldn't be a requirement.

** Flame off

As usual, comments?

Yeah, I remember the ULCNET article... will have to dig that back out of the pile...

>I don't know what it would take to convert the SLIP driver to use this,
>but thought it might at least give you some ideas.

As I recall, that also involved using a small circuit to drive either DTR or CTS on the serial port, or maybe it was DCD... as an indication of activity

on the cable. All that would be needed I think is to change the initialization for the 8250/16450/16550 serial port IC in the asynch driver code to turn on hardware flow control outbound, so that the PC wouldn't transmit when the cable was in use.

I think it'd be a near-trivial mod, but I don't have time to pursue it.

But BTMA is at best, a patch, and at worst, a resource hog. Assuming your channel is full duplex at the node, it makes no sense to throw away half of the available thruput transmitting a busy tone when data

could occupy the same slot. I also fail to see how digital regeneration
buys one anything either. Even if an incomming packet is corrupt, the
busy tone must be transmitted for the duration in order to prervent
the next station in line from also trashing its packet in collision.

Here in Atlanta, we run a full duplex digi/switch on 146.73/13. We
started out with busy tone and quickly realized that we were throwing
away half of our thruput potential. The switch currently has a simple
hardware bit repeater grafted to the modem disconnect of a TNC-2.
This is still a suboptimal solution since the bit repeater tends to
accentuate the clock jitter produced by the TNC-2 clock recovery
state machine.

An optimum configuration would probably have the transmitter keyed
all the time. Flags would be transmitted the instant RF carrier is
detected in the receiver which busys the channel until the transmitting
station can stabilize and start data transmission. A simple audio
path between the receiver and transmitter is probably more than adequate
and demonstrates a high KISS factor. Voice users are excluded through
administrative or military means. This would, of course, require
true DCD on the users' stations.

John

Just a really really dumb thought....
If anyone were to have a crosband repeat dual bander (ie 731/631,th75),
all three bands could be linked.

IMHO Actually it probably isn't that dumb an idea, since I usually
set up my 721 at most hamfest to cross band 440 and 140 for handheld
use :-). There are also the low power freq areas for use if you use 5w.
or less to get away from the norm.

I have used (in the past) a multi-drop configuraution, but not using

rs232. The rs232 was converted to 5Volt differential drivers and
and thus bused together. (I don't have any of this handy, but I still
have some of the WW boards to llok up the parts, schematics). This
allowed up to 30ish users on the same 4 wire system. Doesn't rs422
or one or one of those (I don't recall) specs allow multidrop??
Anyway these converters were cheap to build, and worked fine at
56KB.

Payne) writes:
>   Instead, I claim that the main inhibiting factor for TCP/IP is
>ignorance. People avoid what they don't understand.

Agreed. There is no such thing as a free lunch, and even when the
software for a powerful networking system like TCP/IP is free, you still
have to understand how to set it up and use it. But things are
improving.

> Relatively few people
>have seen TCP/IP running, and even those that have can be in the dark. I've
>talked to people on packet that they want to replace AX.25 with TCP/IP for

>were shoved over AX.25 links, and how TCP and IP added overhead to each
>packet.

Yes and no. The per-packet overhead of POATS is already so large that adding TCP/IP headers makes little incremental difference. More important factors are the differences in protocol behavior and implementation such as retransmission, backoff and packetization strategies. I would argue that TCP/IP running atop AX.25 in the UI (connectionless) mode usually achieves better overall channel throughput than most plain old connected-mode AX.25 channels because TCP deals much more efficiently with lost and duplicated packets, and because the data packet sizes are generally more reasonable (why, oh why does it seem that every BBS in the world sends no more than one text line per frame, even when the lines are 2 characters long??)

> Also, in supposrt of this point, compare the implementation of
>Net/Rom to TCP/IP. Unlike TCP/IP, few people have network nodes in their
>house.

Everybody who has run my package for the past few years has had both a TCP/IP *and* a NET/ROM node, thanks to the efforts of W9NK (the original author of the NET/ROM implemenation in my package) and SM0RGV (who ported it to NOS).

> Rather, Net/Rom nodes are erected for public use, with POATS
>up and downlinks. Because of this, the general knowledge of Net/Rom
>(and other networks configured in the same way: ROSE & TexNet) by average
>users is much greater than the knowledge of TCP/IP.

With the "mailbox gateway" feature now in NOS (again courtesy of SM0RGV), there is really no fundamental difference between a "network node erected for public use, with POATS up and downlinks" that speaks TCP/IP on the "network" side and one that speaks NET/ROM, ROSE or TexNet on the network side. Any differences in general knowledge are probably due instead to the relative popularity of a given system.

> Finally, (and sadly), politics is a major problem in packet radio
>networking. You have the TCP/IP, Net/Rom, ROSE, TexNet, DX Cluster, and
>POATS camps. The less each knows about the other, the more "racist" the
>politics problem becomes.

Yes, politics is a problem. But TCP/IP is unique in demonstrating that it can work with and build on the facilities provided by these other networking "camps". IP datagrams are routinely sent across NET/ROM backbones, and the incorporation of NET/ROM functionality into NOS allows what are nominally "TCP/IP nodes" to handle "pure" NET/ROM traffic. No other "camp" in amateur packet radio has demonstrated this flexibility. That's why TCP/IP is called an "internetworking" protocol.

> In light of the above observations, I think the networks should be
>designed with the lowest common denominator in mind: POATS.

This is amateur radio, and our networks are being designed and built by volunteers. Since they aren't paid (and in many cases have to dig into their own pockets for funding) it seems a little unfair to criticize

them for building the network as they see fit. If you disagree, you are more than free to build a network the way YOU want it, as long as you raise your own funding. In fact, you should feel free to build the service you want on top of the network I have built.

Assuming we can use our spectrum reasonably efficiently, there should be enough room in amateur radio for everyone with an idea of how a network should be built.

Phil

>operating under TurboDOS in an IEEE-696 environment.

Indeed! A few years back I used a Sierra Data Sciences S-100 system with that exact configuration running TurboDos. It was quite a system for its time! I believe that the way the bus sharing was accomplished was by having the master processor poll each slave for I/O requests. The only job the master had to do was to check each slave in turn and if the slave requested I/O then the master performed the requested function. I'm sure that there was some sort of time slice algorithm too, because we never had any problems with one of the slaves 'hogging' the I/O.

Like I said, it was quite a dynamite little system with 1 master/4 slaves. Each slave had its own terminal port, and did we ever keep that little sucker busy! The master controlled all I/O to the hard & floppy disks. It also maintained a print spooler to organize print requests. We even had an 8748 emulator board & cross compiler for doing software development

for embedded microprocessor systems. When we ran the emulator, there was
some bus contention, and we had to limit the system to a single slave
to avoid crashes while emulating.

This might be one good explanation. But I guess it's not the only one.

We had a little 'burst' of TCP/IP activity around here about a year ago
(maybe 1 1/2 ?). I organized the IP-address scheme for northern Germany
and managed requests for IP-addresses. Everyone who requested has got
TCP/IP (CMU, KA9Q, NCSA) from me for his tests/QSOs/installation/etc.

But since about one year no more requests dropped in here. Most TCP/IP
activity around here vanished. Even those stations formerly working
on TCP/IP changed over to different systems. So it could hardly be
a problem of ignorance (even though there is allways some).

But what are the reasons?

My answer is simple: There is no simple answer|

Maybe some HAMs treat TCP/IP as a dying standard. Most international
commitees expressed their intention not to establish any new TCP/IP
version. Instead an OSI conforming standard shall be supported (whatever
it may be some times). Maybe some HAMs are waiting for a AMPR version
of such a standard. I understood RATS was going that way.
(This does NOT relate to the fact that TCP/IP is still the only reliable
and independent standard on an ETHERNET for all different kind of machines.)

Maybe other HAMS feel TCP/IP was developed for another world where
some criteria is totaly different from a HAM world (reliable nodes,
stabil links, coordinated management, etc).

Maybe some HAMs don't know how to spell it,

or whatever else....

But these are only individual opinions NOT to use TCP/IP, but what are
the reasons to use other systems?

The summe of different aspects could bring some explanation.

At the user site we have some fine terminal programms around here. These
programms allow to 'TELNET' to other station(s) on one or more channels,
transfer files on another channel, and route/connects through the
network on a 3rd (4th, 5th,...) channel. TURBOPR (for PCs, by dl1bho)
or DIGICOM (for c64s or c128s, by dl8mbt) are some good examples.
Even subconnects through these programms to 3rd stations are
possible (or to another frequency/band).

On the network site we have a system of several hundreds of (mostly)
TheNet nodes. TheNetNode is catching up right now. So users might ask
their node what other TheNet nodes in Denmark, Netherlands, Belgium, France,
Swiss, Austria, Hungary, etc, etc are active right now and connect through
(if the coresponding RF-links are reliable).

And there are BBSs in this cellular network. Meanwhile NORD><LINK's
TheBox (by df3av) became somekind of standard right now in western
Europe. It supports several TNCs, individual language per user,
multiconnects, gateway functions PR/AMTOR, auto-forwarding,
remote-sysop-maintenance, file compression on forwarding links, life
time management, help menue, etc, etc.

All of these items are designed to work together in a network and
support each other. So if one looks at just one of the items the comparisons
to other systems will allways be a miss. But if you look at it together
this maybe an answer why other HAMs prefer other systems.

Maybe...

This has to be one of the main 'requisitions':
as long as an IP layer runs it's own protokoll including checks for
error recovery (because it doesn't rely on it's layer 2) the
protocol overhead would be tremendous.

>(why, oh why does it seem
>that every BBS in the world sends no more than one text line per frame,
>even when the lines are 2 characters long??)

This is one good reason to run NORD><LINK's TheBox. It doesn't only
fill up the frames up to the parameterized limit, additionaly a
compress modus could be switched on. So up to the double amount of
bytes could be squezed out of one I-frame.

> An optimum configuration would probably have the transmitter keyed
> all the time.

I don't think this is necessary; DPLLs in the RX clock recovery circuits could maintain coherence with the TX clock for quite a long time, depending on the bit rate. For 9600 bps I calculated that a DPLL based on a one ppm crystal oscillator could maintain the phase OK if the TX beacons once every idle minute.

> Flags would be transmitted the instant RF carrier is
> detected in the receiver which busys the channel until the transmitting
> station can stabilize and start data transmission.

> A simple audio path between the receiver and transmitter ...

These two concepts seem incompatible to me because the phase of the flags would be incoherent with the phase of the received data.

However, if using a bit-regenerating type of repeater, and if the RX and TX clock in the repeater were tied together (i.e., no RX clock recovery circuit) , it would be possible for a user to synchronize the phase of his TX to the repeater's RX by using his own RX clock (recovered from the repeater's TX) as his TX clock and adding a phase shift to account for the round-trip speed-of-light delay to and from the repeater. This scheme would eliminate synchronization delays altogether except for when a station first went on the air.

This would probably work only at lower bit rates like 9600, where the wavelength of half a bit is sufficiently large to swamp phase changes due to multipath and other things. Users could find the necessary phase shift between their RX and TX with the aid of a map showing the required phase shift in rings around the repeater site. Or else by good old just tweaking it until it worked.

Does anyone do this? What is the loss of efficiency due to syncronization?

Subj: Some WEBER "Raised Cosine" Notes

Dumped on 17 Mar 90 00:00:08 Saturday by ELE093

 From: JAMES MILLER G3RUH via TMAIL Address: UOSAT
 Date: 1990 Mar 16   =====

                     RAISED COSINE SPECTRUM ETC
                     ----
                       by James Miller G3RUH

 WEBER is using different transmit waveform filtering than the others.
The baseband shape of a Weber bit is   D(t)*(1+Cos 2*pi*t/T)   where:

  D(t) is the data, = +1 for logic "1", = -1 for logic "0",
  T is the bit period
  t is time - runs from -T/2 to +T/2 for each bit.

This is the "raised cosine shaping" you hear being discussed. If you plot
out the formula A = 1 + COS(X) , with X = -180 TO +180 deg, this should be
quite clear.

The spectrum of this signal is -3db at +/-1200 Hz, -11.5 db at +/-1800 Hz,
NIL at +/-2400 Hz, and the first sidelobe is a negligible -32db at +/-3000
Hz.

In contrast, the shape of PACSAT, and LUSAT is approximately D(t), which
is "straight PSK". Each bit is rectangular. Most of the energy is
contained between the first nulls at +/-1200 Hz. The first sidelobe is
-13db at +/-1800 Hz.

So roughly speaking, the Weber modulation spreads some +/-2400Hz whereas

the others are +/-1200 Hz. You'd expect this because the Weber bits are "narrower" than 1 bit; compare your 1+COS(X) sketch with an enclosing rectangle.
H
 Now the receiver 3 db bandwidth is typically 3 kHz, i.e. only +/- 1500 Hz, so a certain amount of Weber energy is lost on reception. Or looked another way, the transient phase response of a typical SSB receiver to Weber data will show transient loss of coherence. This is why the LOCK LED flickers in some systems, and the bit error rate can be higher - insufficient receiver bandwidth.

The theoretical minimum RF bandwidth required to transmit 1200 bps binary PSK is 1200 Hz, i.e. +/-600 Hz. A practical minimum, which is achieved by the sort of technique I use in the 9600 baud modem TX secti is approx +/- 900 Hz.

Weber uses a look-up table on a bit by bit basis; it's a "1 bit finite impulse response" shaping filter or F.I.R. The 9600 baud modem which is on UOSAT-D/UO-14 looks-up over a span of 8 bits. So the audio spectrum is correspondingly tighter, and by design has sidelobes at least 50 db down. The waveform is the same as my eprom TXBETA1's Selection 0

By the way, you could also use my 9600 baud modem to drive a balanced modulator to generate very sweet 9600 bps PSK. The RF bandwidth would be about 15 kHz.

 73 de James G3RUH @ GB7SPV 1990 Mar 16

P.S. Sorry if you knew all this already. I've had many enquiries, so this response seemed appropriate. I haven't seen it published elsewhere.

Anyone know what the latest version of Msys is and where I can FTP it from? I'm pretty sure there's a version after1.06, but could be wrong.

Also, Regarding View, Is there a source other than Hamster.business.uwo.ca
from which I can FTP it? For some reason I haven't been able to establish
an FTP session with Hamster.

Thanks and 73, Joe, kc2yu, kc2yu@kc2yu.ampr.org, kc2yu@nn2z.nj, SKOHC@CUNYVM

BM is a smalll model program, on DOS and takes us around 94k of memory
if you set the size of the mailbox to about 400 message. The size
of the object file is about 33k and even if it used all its data
section the that would be another 64k so I would say the way I have
it written its wont use more that 96k. If its crashing its must be
due to some other problem so mail me some more details.

How many message are in you mail box ?

In this part of the country, a LOT of work has been done with the
NET/ROM and TheNet systems. What you say is DEFINITELY true; you
will get a much better response by using a single-port node as a
digipeater than as a single-port node. This is true for both reasons
you noted: hidden-transmitter, and the fact that the "node" is no longer
a digipeater leaves us with the fact that it is another station
competing for air-time. Throw into this an occasional nodes broadcast
and things get worse.

HOWEVER, make it multiport and it's a different story. On a
multiport node (usually three transmitters: a user uplink, a
backbone link going in one direction, and a backbone link going
in the other direction) the TNC's are separate and can transmit
simultaneously. While it's ACK'ing you back on the uplink, your
packet is going out. For this reason, a club has a lot of
motivation to chip in for their higher-speed modems on the
backbone links rather than all individually upgrading as users.

One statistic that comes up time and time again with the N.E.D.A.
experiments is in the arrangement of backbone links. Even if these
links are hidden-transmitter-free, if you've only got two stations
on frequency, you get a FIVE-TO-ONE IMPROVEMENT over adding just

ONE MORE transmitter. We can prove this with channel-usage
analysis quite easily, and it's also quite logical (I'll continue
if there's interest in this topic).

The point I'm trying to make is that single-port nodes are, in most
cases, not only completely useless but actually damage the channel
more than a plain vanilla digipeater would. IN MOST CASES.

Joe--

As previously announced in the AMSAT bulletins that Phil Karn posts,
AMSAT will have an extensive redistribution network active during
both of the next two SAREX missions.

Ref:
Navy's Use of Shipboard Packet Systems

A technical abstract is being created to provide appropriate officials within the US Navy telecommunications community with an explanation of packet radio and how it may be utilized to move non-tactical mission support (supply and maintenance) data from ship to shore based host computers.

I am serving as the coordinator for this effort representing a coalition of packet enthusiasts. My interest is scholarly, I want to see US Navy shipboard telcommunications improved.

I am requesting individuals with appropriate contributions to E-mail me your comments and ideas (so far I have received very good feed-back). I will be broadcasting draft abstracts to allow interested parties a chance to chop on the document.

The Navy is interested and wants to hear more, let's organize a top notch document.

Sincerely,

Dave Sweigert

I have convinced my professor in my "Computer Communications" class that a paper on amateur packet radio would be an appropriate project for his class. However, I now have the task of explaining the workings, use, and problems concerning packet radio. Unfortinately, packet is not a mode that I am intimately familiar with. I know we have many Packet Gods out here, so I would like any reccommendations on books, sources, papers, articles, people, etc. that would aid my endeavor. I only need to fill about 10-15 pages, but I would like to learn as much as I can. (Plus I'll find out what I want to buy when I get out in May....)

I already have the AX.25 book, Gateway book, and Computer Networking Conference books from the ARRL on order. Other reccomendations would be appreciated.

Reply by mail, TNX in advance...

Scott

Breckenridge) writes:

   One of the downsides is that the TB works like a spread spectrum
   audio channel, I don't know whats going to happen with fading etc...

You're going to have all kinds of trouble. If the modem desides to
"retrain" based on selective fading, you're going to lose that portion
of the audio channel. While this is all well and good when the link
takes a dive, the modem doesn't "retrain" when conditions *improve*
therefore selective fading could eventually reduce your throughput
to zero.

stuff deleted....

Unfortunately, the recent hacker gang from West Germany was able
to defeat the encryption used in Unix systems, (Is this DES???)
if the account that I read was accurate. It *did* involve the
assumption of common language words as passwords, combined
with leading and trailing ascii charecters.
(IE: camel1, 4pony, etc.) It also involved being able to look at
/etc/passwd, which in most newer systems does not divulge anything.

Users seem to have favorite words as names to use as passwords, and
attempts by Unix to make them more secure usually result in adding
simple non-alphabetic chars. to their favorite word.

Bottom line.... Unskilled, but clever hackers with pc's and modems
found lots of holes, and used them to "back into" secure passwords.

They could not do it every time, but they were able to back into
enough passwords to do their "thing".

The ironic thing is that they would have been easy victims of
their techniques! (I guess that is why they got caught by an
astronomer/physics type!) 8->

Anyway, the account was interesting reading, and I am sure
everyone has heard of it. But it was an example of people
defeating, if not breaking encryption. (Kind of like kicking
in a door that has 2 strong deadbolts on it. doesn't make much
difference if the door frame isn't strong also!)

No claims to cryptography (or spelling) expertise here!
(so don't flame too hard! :->)

This question has been asked, and I wasn't interested at the time.

Is there any software around? I know that there is a version of tcp/ip some where and I understand Phil Karn wrote his eary stuff on CP/M. Does somebody have the early Karn package? Assuming it exists of course.

I sort of hope there isn't any, then I will have to write some. Build an interface and shoot for 56k :)

Gee that's really awful. (The tornado taking his antenna out).
What about getting together a net-wide collection for reconstruction funds. After all, that system was an asset that AMSAT used to recover a very expensive satellite, and it might be needed again.

I don't know he owner personally, but such an array must have cost a fortune to construct. (Was this the one that appeared in the ARRL antenna book a couple of years ago?) If we get an estimate of how much it will cost to put back together, I'm willing to sign

up to contribute...

There was a tremendous amount of requests for the new TheNetNode.
So here is the answer to all those questions asking for availability.
Please forgive me if I couldn't reply to all individual requests.

For all those netlanders who didn't caught the first intro of
TheNetNode here is some short info (again).

TheNetNode

by NORD><LINK

This new Version runs entirely inside a PC or Atari computer and uses
TNC2s with a special KISS Eprom as an "intelligent interface".

New features are:
 - up to 255 Channels on one Computer
 - Call forwarding (just connect MYBOX, the node will know what call
   to connect you with and how to get there. If a BBS is down the sysop
   may set a route to an adjacent box.
 - Converse Mode
 - Monitor Heard list
 - Help system expandable by sysop
 - Software updating thru radio
 - Watchdog hardware for TNC and Computer (simple)
 - Sysop has full remote access do DOS
 - sophisticated statistics done for every channel (quality, thruput, etc)
 - written in C (we use Turbo-C 2.0)
 - TNC-KISS firmware with TOKEN-RING protocol

Hardware? Only standard items (plus simple watchdog). The PC and all TNCs
are connected together in a token ring.

Fortunatly some kind OM offered to translate the german version of the
doc to an english version. This might take some days.

TheNetNode will be uploaded to some servers / mailers. As I don't
have direct access to SIMTEL20 this will be done by that OM too.

Like before all software of NORD><LINK is priced at 00.00 $. It may be
used freely for any amateur application, modified, and redistributed
under the same conditions. But there are restrictions for
commercial users.

If you don't like to wait for the software to be available on a server
you might get it via regular mail. Any PC size disk may be supplied.

Send your request to

NORD><LINK e.V.
Hinter dem Berge 5
D-3300 Braunschweig
F.R.G.

Remember: the software comes at no charge, but you have to care for the
expense of postage, air mail costs, floppies, etc. So be shure to include
sufficient IRCs or dollar bills at your choice to cover the costs.
A mailing label with your own address would be very helpfull.

More details will be available soon.

Detlef (dk4eg)

Is anyone successfully running packet on a DEC Rainbow? I have one available
to me with both DOS & CP/M, 512K. If anyone knows of software that works with
this machine, I'd appreciate any information you can send me about it.

Thanx...

Barry,

Yes, this phenomenon is quite real. At the ARRL conference a few years
ago (when NET/ROM was still fairly new) I used exactly the situation you
describe (replacing a digipeater with a NET/ROM node) to illustrate the
fallacy in Software 2000's marketing claims that hop-by-hop
acknowledgements are all that's needed to solve amateur packet radio's

collision problems. In some cases, such as the one you describe, the addition of hop-by-hop acknowledgements only makes things worse because of the synchronized ack/data collisions (not to mention the extra overhead of the acks themselves).

Of course, digipeaters aren't ideal either, as it was their poor performance that motivated the development of NET/ROM in the first place. PRIACK is a step in the right direction, but it's just a heuristic that doesn't solve the fundamental problem: finding some way to either avoid collisions or limit their impact on channel throughput.

Several such schemes have been proposed, ranging from full duplex repeaters that eliminate hidden terminals and allow for collision detection (CSMA/CD) if the user terminals are also made full duplex, to abandoning multiple access schemes altogether and relying exclusively on point-to-point or point-to-multipoint schemes. I've suggested some of these myself, and N6GN is now probably the most vocal proponent of the point-to-point approach.

However, if you believe (as I do) that even with lots of point-to-point links there will still be a need and a place for multiple access operation, then we still need a better solution to the collision problem. Yet another possible scheme would be CSMA/CA (collision avoidance) modeled after Apple's Localtalk network. Basically each station sends a short "request to send" (RTS) message to the destination station and waits for a "clear to send" (CTS) reply before sending the actual data.

Stations hearing a CTS would stay off the channel even if they had not heard the RTS that caused it. This is the key feature of the algorithm, as it causes hidden terminals to remain silent until the traffic can be sent. (The RTS messages would indicate the amount of traffic to be sent, and the CTS message would echo this so the other stations would know how long to stay off the channel.)

It is still possible for collisions to occur, but they should happen only between RTS messages. These are much shorter than data packets, so not as much channel time should be wasted by them. Obviously this scheme works best when the stations have lots of traffic to send in each RTS/CTS/data cycle, and there should be a bypass mechanism to allow a small amount of data to be sent without the RTS/CTS overhead. (You would, however, still have to obey the CTS holdoff rules).

There are also some nifty extensions that you could make to this scheme for power control. If the CTS message includes a relative S-meter indication, then the sender could determine how much power is necessary to reach that station. By caching the responses in a table, the sender could use different amounts of power depending on how much was needed to reach a given destination. This alone should result in a considerable increase in system throughput when a single channel is used by many stations over a wide area (e.g., 145.01 MHz in many areas).

I would really like to see people analyze this protocol further and give

it a try. I think it would help performance on single-channel networks much more than hop-by-hop acks and PRIACK.

>1. Has anybody already done this? Hints? Pitfalls?

Eh??!! I've been using Turbo-C (version 2.0 Professional) to develop my code for perhaps two years now. You must have a *very* old version of the code that dates from when I used Aztec C as my development base.

>2. What memory model is required for NET? Should I use Large?

I've been using the "large" model (large data + large code) for quite some time.

>with leading and trailing ascii charecters. [...]

Conventional UNIX systems use DES in a "one-way function" mode so that
only encoded passwords need be stored anywhere on a system. There is no
known way to reverse the one-way encoding (which depends on the security
of DES to known-plaintext attack) BUT an attacker can try to brute force
the system by trying large numbers of keys to see if any produce the
same encoded result as the one they're trying to determine.

I'm thoroughly familiar with this type of attack, as I have done it
myself for some time as a way to find weak passwords and get them
changed before the hackers discover them. That's why I specifically
qualified my statement about DES. The keys MUST be chosen from a large
enough space that they cannot be found by a brute force search. The
best-built combination lock in the world is worthless if people set the
combinations to "obvious" values.

For more details on this whole subject, see the paper by my colleague
Dave Feldmeier (AD3J, btw) and myself that we published in the proceedings
of the Crypto '89 conference.

Yes, my code did indeed begin life on CP/M, specifically the Xerox 820.
But this was five years ago, and much has happened in the meantime to PC
clone pricing and availability to make me wonder why anybody would still
be interested in CP/M. With XT clone boards having bottomed out at $60
or so, and with a well-established and highly competitive supplier network
supporting PC technology, why bother with Z-80s and CP/M? I just don't see
the point.

The following is a relatively easy modification that allows reliable 19.2
K baud on the serial port and radio port of most TAPR TNC-2 boxes.

***** FIRST AND FOREMOST *****

Replace U3 (LM324 op amp) with a TL084CN or TL094 if no TL084CN or eqiv. This is a high speed JFET hi-Z op amp. Just that fix alone will allow you to run 9600 baud on the serial port to your computer. I found that the TAPR 1.1.6. code WITH the PMS ran without any serial port misbehaving BUT it was sluggish. The 1.1.6. code (or lower) without PMS is quite a bit quicker.

***** 19.2 K *****

Cut the PC trace that goes to pin 2 of divider U1 about 1/8" from U1. Run a short jumper from pin 10 of the divider U1 to the side of the trace you just cut that goes to the SW2 baud rate switch. This is the side of the cut opposite to pin 2 on U1. This supplies a 307.2 K clock to pin 1 and pin 6 of the SW2 which NO LONGER SELECTS 300 BAUD.

The 307.2 K is 19.2K/16 which is fine and dandy. To run 19.2K on the serial port, turn SW2 switch 1 on. SW2 switch 6 selects 19.2 K to the MODEM port, switch 7 selects 1200 baud to the modem port and switch 8 selects 9600 baud to the modem port.

(keep in mind to leave switch 7 on unless you have installed a higher
  speed modem in your TNC)

We are running 19.2 K serial and 9600 baud radio with G3RUH modems and kantronics DVR 2-2 radios with excellent results. Next step is to up the G3RUH boards to 19.2 K by replacing a couple of capacitors.

OHHH WHAT A FEELING.......

Well Phil, I too have a desire to run a tcp/ip package on my cpm system.

My reasons are:
A. I have a Televideo TS802H (10 meg hard drive) still in excellent condition
   and I can't think of a better use for it.
B. I have invested several thousand dollars in my current development system
   and can't afford to let the thing run day and night for packet.
C. I have no real desire to own a pc clone at any price.

So, if you do still have some CPM code laying around that would run on an old
CPM box I am sure a lot of those good old CPM boxes cound use the work out.
Thanks, and 73, Mike WQ0N

RTTY DX Notes, 1of3, 4/6/90

RTTY DX Notes for Weekending 6th April 1990.
Part 1 of 3.
BID: $RTDX0604

Oh dear. Just when we thought that we had all the frequency problems
solved with the packet chaps, here we go again. Now, because of QRM,
the ARRL wants the FCC to give them their own special frequencies for

unattended operation, at the expense of the RTTY/CW operators. But I thought it was an error free system, or has someone been telling me lies again? Why don't they dash off to 10, 18 or 24 MHz and leave the gentlemen alone? Write to the FCC and ARRL and point out the error of their thinking, but do so before April 23, and make it good and strong.

Our thanks this week go to G0ABI, I5FLN, I5ICY, I5IGD, OD5NG, TG9VT, VK2EG, VK4DXN, W1DA, WA1URA, W2JGR, W0LHS and the Tri-State DX Association VHF packet cluster. Thanks chaps for all the information. It's really appreciated.

SB ALL @ ALLUSA $RTDX0804
RTTY DX Notes, 3of3, 4/6/90

RTTY DX Notes for Weekending 6th April 1990.
Part 3 of 3.
BID: $RTDX0804

Notes Of Interest:

Ron, ZL1AMO reports that he will be signing ZK2RW this coming week for a two week stint. QSL to his home address.

Aves Island is still on schedule, and should appear on 11th April through 15th April, all digital modes, RTTY, AMTOR and packet. RTTY will be on 087 on all bands, and they will listen on 090 to 099 KHz. Packet and AMTOR will be on the normal frequencies for these modes.

Jarvis Island is also on schedule, they should appear on 13th April until 23rd April. Their calls may be either AH3C/KH5J or AH3C/KH4J. It is believed that they will be OK for DXCC.

Burma was supposed to show on March 24th, but nothing heard. Maybe it will not occur.

Spratley seems to be going fine, though there have been no reports for some weeks. Keep your fingers crossed.

VU7JX, JS, reports that he had 6500 contacts from the Laccadives. JS says that he has answered all cards received, but if you want a card, please send a SASE before the end of June. After that date all blank cards will be destroyed.

Packet in China. BZ1FB reports that he has a packet BBS in Beijing on 21101 KHz from 0900Z until 1500Z and on 14105 KHZ from 1500Z until 2400Z.

Jim, A51JS, has some small problems, like snow, power failures, and his hosts being overly kind, but he keeps trying to get on the air. So be patient, he will make it.

GL DE DX1 (VK2SG) VIA TG9VT.

I'm looking for anyone who thinks they can help resolve problems I'm having connecting a PakRatt PK232 TNC to a Kenwood TM-221A 2-meter radio.

The cable I created is home-brew and does NOT contain the same "color" wires as the standard PK232 cable, but it should be adequate. It is shielded "4-pair" standard computer cable, containing two twisted wire pairs: one is white / black, the other is red / black. Standard berg connectors is used on the TNC end and an 8-pin DIN is used on the radio side.

There is no close match that I could determine from the Appendix K "Radio connections" section of the PK 232 manual....the closest one was the Kenwood 8 pin....and as far as I can tell, it's not sufficient. Anyway, I used the descriptions supplied in the PK232 manual/schematics and the descriptions supplied in the TM-221A manual to come up with these connections:

TNCpin	PK232 color	My color	TNC function	Radio function	Radiopin
1	GREEN	Black(wh)	RX Audio	RX detector O/P	6
2	WHITE	White	TX Audio	Microphone Audio	1
3	BLACK	Black(red)	Squelch	?	N/C
4	BROWN	Shield	Ground	GND (Microphone)	7
5	RED	Red	PTT	PTT (stby)	2
4*	SHIELD	Shield	Ground	GND (PTT)	8
N/C				DOWN	3
N/C				UP	4
N/C				8V/Max 15mA	5

*I assume that Shield and Brown are wired together in the standard PK232 cable....in any case, used the Shield in place of the Brown and write radio pins 7 and 8 together at the Din connector.

The only description supplied in the PK232 manual for connection to "Kenwood 8 pin" connectors shows:

PK232 color	Radiopin
White	1
Red	2
Shield	7
Brown	8

with this at the bottom of the page:
NOTE: On all radios, the shield should go to the same place as the brown

wire, unless otherwise noted.

With this cable setup, I find that I can transmit (I can see the S meter on the radio go to full scale), but I can't seem to receive. There is sound coming out of the speaker on the radio, so I can hear signals coming in, but there is no response from my computer, and the threshold leds on the TNC do no flicker. It's almost as if there is a broken wire on the receive side.... but I did check the cable with an Ohmmeter, and it's ok.

Now, the TM-221A manual shows that the pin 6, which is the RX detector output has only approximately 150 mV/600 ohms. I'm not entirely sure what that means, but I'd think that 150 mV would be sufficient signal. The only other thing I can think of doing is to open up the 2 meter radio and run a wire direct from the speaker.....the catch is, it's not my radio, so this isn't a viable solution.

Has anyone out there had any experience with TM-221A as a 2-meter packet station? If so, could you tell me how you wired your cable?

Thanks for your help in advance.

Thanks to all of you for your great help, in particular with the R-C hack to get my TNC to work with my ICOM 2AT. The last obstacle to hurdle happened last night ... I turned down the volume on the HT and *bingo*, I got a connection!! Anyway, I'm in business.

There has been much communication and discussion in recent weeks
concerning DAEDALEAN's proposal for transmission of non-tactical
ADP mission support data for the US Navy. DAEDALEAN is expanding
the original proposal to include packet radio.

Why ?

The time is right to explain packet radio technology to the
appropriate Navy planners who are tasked with understanding
emerging technology.

DAEDALEAN has two proposals on the table being reviewed by the
Space and Naval Warfare Command for utilizing INMARSAT L-Band
(1556 Mhz) satellite channels as a network backbone for the
transmission of mission support data (logistics and maintenance).

DAEDALEAN's interest is to see the efficiency of this new
technology promoted to the military as a method of modernizing
existing fleet ADP communications channels.

More data shall be forth coming---

International Packet-meeting in Frankfurt

In cq-DL 3/90 is a small announcement about the 6th International Packet-Radio
meeting 21 and 22 April at the university of Frankfurt, Robert-Mayer Str. 2-4,
Frankfurt. Both days start at 10.

I am located in Holland and couldn't find more information.
Before I will go to this meeting, I must have more information.

Is there a program, hotels, etc?? I haven't an email address of someone
near the organization (UUCP, Bitnet, Hamradio packet).

Henk Peek, PA0HZP, UUCP: henkp@nikhef.nl, Hampacket: PA0HZP@PA0RYS
                    Mail: H.Z.Peek, PB329, 1440AH Purmerend, Holland.

Ps: We are with a small group.

This is my first posting, so if I mess up don't flame me too badly.

I am currently trying to build a synchronous interface card for IBM compatibles, specifically to drive the WA4DSY modem at 56Kbs. I know that the "Awsome IO" card is coming, but I wanted to try it myself and perhaps make something a bit simpler. The card uses an 8530 SCC and uses a DMA channel in the PC in half duplex, single transfer mode. It works most of the time, but here is my problem:

To transmit, I program the DMA controller, unmask it and select TX DMA in the 8530. Then I reset the end of packet flag so a CRC will be generated when the DMA stops feeding bytes to the SCC. An external status interrupt occurs at the end of message, and I use this to end the transmission (after a delay to allow the CRC and flag to clear the chip). The problem is, it seems sometimes I don't get the interrupt at the end of the packet, and the transmitter stays on, hanging things.

If anybody has run into this or has any ideas, I'd appreciate hearing from you.

PS. The problem only happens when the card is busy, like when using FTP (I have written a driver for Phil Karns' NET package). If traffic is sparse, as when pinging the other machine (I have two of these set up for testing), things work fine.

It is probably some silly bug on my part, but I've put in several hours on this so it doesn't hurt to ask. 8-).

Phil, maybe he likes it! I have a Molecular Mod. 9 in my little room with 2
Seiko 8610's nearby. All operational, all (gasp) CP-MP/M or N-Star and all
multi-user. Nice machines, fun to hack on and just play with. There is
LOTS I'd like to find for these 2 (Seiko and Molecular) machines as
well. Also have a PC next to the Seiko's. The Seiko's are more fun. I'd
like to find a terminal program that will run on the Seiko's 8086. Maybe
even something for the Mole's 8080. Maybe you don't see the point now
but lots of us still like to play around with admittedly older but
sometimes more intriguing systems.

BTW, if anyone DOES have any term program that'll run on either of these
'old technology' :-) machines, I'll be happy to hear from you.

     This item joggled my memory about a question I've been meaning to ask for a while. What's the smallest PC system configuration you can get away with? I had in mind: motherboard, drive controller, drive, power supply, and any necessary packet I/O boards. No display card, display, keyboard.
     Motivation being setting up a dedicated packet switch. It sure would be cheaper than outfitting a full system and would be less power hungry.
     I know my BIOS would balk right away at no display and keyboard, but I was wondering if anyone had tried such a configuration?

     Any comments appreciated.

Thanks to Phil and Chris for their comments. I agree that new approaches to CSMA are needed... we will likely pursue the collision detection approach on our 56kbs MAN, and the Localtalk collision avoidance protocol offers some intriguing possibilities for dealing with hidden transmitters. Right now, though, I'm concerned with the short-term problem of helping

those poor blighters in the 1200bps trenches :-). Any performance tweaks which can be easily implemented and offer a significant improvement in channel usage are worthwhile, I think. The TAPR DCD upgrade is one such. PRIACK could be another, but if it cannot be applied to nodes, BBS's, and many of the user stations, it won't have much impact. It appears to me that adding PRIACK to KISS would be a rather difficult hack, so maybe it would be better to put the effort into other CSMA strategies.

It seems clear to me that, whatever else we do, we should strive towards having *only* full-duplex repeaters on multiple-access channels. This will never happen with the present 1200bps frequencies, but should be kept firmly fixed in mind as users start to gravitate to 9600bps and new MANs get set up to accommodate them. Repeat after me: "I will NOT put up a 9600bps half-duplex node/digi". Let's not repeat our past mistakes.

Barry

Our group in the Los Angeles / Southern California area has been building up low-cost PCs for packet switching nodes for the last year or so. Being in SoCal, the land of the cheap clone and 100000000000000000 Chinese computer vendors, there's quite a good selection of components at cheap prices. And, if the stuff doesn't work right, the vendors are usually local.

Anyway, a 10MHz XT mother board w/ 0k RAM can be had for as little as $53; I've even seen a few 12MHz boards for $50, but that's a rarity. RAM costs about $1.70 per chip for 256-10 stuff, sometimes a bit more. Nine of those get you the minimum 256k RAM; eighteen are preferable.

Power supplies new are $25 to $35; an old (but fully working) 65 watt supply may be as little as $10. Cases are 10 to 20 bucks, new maybe 25. Monochrome boards are 15 to 20. Dual port serial cards (if you plan on using your standard external TNC2 modem) are as little as $10 with one port stuffed, or 18 to 20 with both ports stuffed.

Most BIOSes that I have seen don't require a keyboard for proper operation; the majority of them will beep and imform you of a system error but will merrily go onward and continue to boot. If you set the switches on the motherboard for an EGA video display, the AMI BIOSes (at least) will happily work without a display board.

So, let's add up what it would cost (on the average) for a very basic PC if purchased on any given Saturday at the Chinese computer Show.

```
10MHz XT board w/BIOS and 0k RAM :   $58
256k RAM                         :   $19
Power Supply and Case            :   $40
Dual-Port Serial Card            :   $19
                         total   :  $136
```

Oh, add six bucks for the admission fee; add a few bucks for gas and parking, and driving time... Then, if you want me to get this stuff for you, add my commission and the total will be about $35,000 @:)...

Adios and 73 - Jon

It has not ceased to amaze me how many people have tried to use BM as a
serious mailer. It has amazed me even more how many people have succeeded.
I wrote it as a quick hack to test out SMTP handling in NET, and to demonstrate
how one might interface a mail user agent to NET.

I suppose it's a tribute to Dave Trulli, NN2Z, who has been the caretaker of
BM for some time... I tried to discourage him early on, but... :-)

And Phil tried to suggest that calling it 'BM' would keep people from wanting
to use "my <bleep>y little mailer"... :-)

End of aside...

Bdale, amused as usual

Hmm... It might help to know what kind of I/O you're using. My system is a Z80b-6MHz (Mostly CompuPro stuff) CPU-Z board,with 3 RAM17 boards (64k that supports the extended 24bit addressing for 192k system ram) , c CompuPro SMB-2 board for boot and some I/O, Fulcrum Tech.'s VIO-X1 video board connected to a Samsung Amber Digital monitor, a ComputerWatch RTC, Two GodBout DISK1 boards (running 2 MPE 1.2mb 8" drives and 4 360k DDDS 5.25" drives respectivly) a DISK2 board connected to a Segate 80mb harddrive (some hack, huh? I'm proud of it!) SSM's IO4 and IO5 boards for lotsa RS232 and Parallel (been working on making this old TRS80 into a parallel terminal(ish) thing since these parallel ports are all Bi-Directional. would be cool) A Tarbell 8" controller that is hooked up to one (wouldn't want more) 256k 8" floppy (only thing its used for is formatting and transfering data to/from the pdp11/34's rx01 drive.. (damn DEC. can't even make their drives able to format a floppy. thanks a lot.) and tto top it off, Jade's "Bus Probe" and a homebuilt Hex display for address/IO... oh, its also using an IBM clone 101 key keyboard (Better than that old IMSAI IKB-1 anyday!)

I'm quite proud of my box, as ya can tell.. anyways, coupla questions...

(oh, if you've got a standard Z80SIO, i've got a great home-hacked comm program.. (well, I'm not responsible for writing it.. My cohort "Dent" is .. full featured and its under 3 K. Great for ROMing.. (It even has SCROLL BACK!! heh. i'll have him post the source.) anyways, coupla questions.

I have another S100 machine that is sitting in my garage waiting to be reassembled. there are quite a few Z80a CPU boards out there. (As in 4 of them. and one 8080 board) i was wondering if anyone knew of anyone else | has info on how to hook up more than one processor to a S100 bus... I'd really enjoy having a multiprocessor Z80 machine lying around, and i could apply the same trick to Leviathan (the big Uzi / CP/M machine described above).. would be a righteous hack.

Thanx in advance, if theres anyone to thank.

Because I own a CP/M box.

Because I like to see how how much can be done with 64k and 4MHz.
Because I don't like 80xx boxes.
Because I feel like it.
Because this is a hobby and economic justification is irrelevant.

I'm going to be traveling around the country starting sometime in the fall, and hope to get personal email and limited file transfers via packet, and (if possible) run a mobile packet BBS or TCP/IP node BBS for techno-nomads. I'm very very new to all this, having barely creased the binding on my just-purchased Q & A reference. I should have my Tech license by June, along with a lot more savvy about all this, but best to start asking questions now!

My current plan is to try to find a good deal on a used dual-band handheld (146/440) at Hosstraders in a few weeks. I want to get one that has the requisite connectors (or modifiability) to hook up for packet. I'd also like to keep an eye out for a good deal on a packet modem. Unfortunately, I'm still so new at it that I don't know what to look for or what to stay away from. Can some of you experienced hands give me a good beginning equipment list-of-suggestions?

(Notes: Of course, I *can* wait until the Fall HossTraders if I have to, but I'd like to be able to snag components that I'll definitely need if I see an exceptional deal! I want dual band because most of my friends in Boston/MIT and the Bay Area are on 440 (including the

MIT packet link), but there'll be many many more folks on 2-meter in the non-urban areas where I expect to spend most of my time.)

Constraints: (flag any that seem unreasonable!)

- assemble complete system (except computer & power) for under $2K

- use Mac SE which I already own (though I will get a PC if I gotta)

- use handheld dual-band which I can remove to carry around

- at least 1200 baud link, faster is nicer!

- able to use satellite, repeaters, or whatever to reach San Fran/Bay Area or MIT W1MX packet-to-Internet links

- able to deal with Packet TCP/IP (this is a big black hole that I've only read about here and don't know the details of)

- assembly possible by someone (me!) who can solder, use a multi-meter, and read (slowly) simple circuit diagrams without understanding them very well. I have a StuDly EE Housemate who could help me etch & load a PC card if that's the One True Way, but I'd prefer to stick with off-the-shelf subsystems where possible/affordable.

- can be reasonably contained & antennaed within the scope of my 18-foot Airstream (shouldn't be a problem, but can't use any 30 foot stationary towers, for instance!) Will I need a mini-dish? Or can I get by with a long antenna along the side which I'd raise when parked?

Thanks very very much for assistance and input! I'm going to collect all this stuff I'm learning into one central reference and put it in Hypercard after I'm set up, share the gift of knowledge and all that. I'm especially interested in hearing from any full-time nomads out there. If they're reading this they're probably doing exactly what I want to do!

73,
_Strata

>It seems clear to me that, whatever else we do, we should strive towards
>having *only* full-duplex repeaters on multiple-access channels.

Even though I'm an advocate of this approach, I'm not sure that it's the
only way to go. The more I look at cellular telephone systems the more I'm
bothered by the traditional amateur approach of finding the tallest building
or mountain in the area and sticking the highest-powered repeater you can
afford on top. This causes a given channel (or channel pair) to be limited
to one user at any instant over a very wide area. And then we wonder why
it's so hard to get channels.

One of the potential advantages of the CSMA/CA scheme, especially if
automatic power control is incorporated, is its inherent ability to exploit
spatial reuse of a common channel. Working against this, of course, is the
added overhead of the RTS/CTS dialog. What I would really like to see is the
result of some simulations that compare the two techniques for a variety of
realistic configurations.

I'm doing exactly this right here. I have a stripped XT that runs my code as a dedicated IP gateway between my shack Ethernet and a 220.55 MHz 56kb packet channel. It consists of a case, power supply, XT motherboard, single 360K floppy drive, Ethernet interface and DRSI PCPA card (to talk to the modem). When I turn it on, it boots automatically. I leave it on 24 hours/day. I can't remember what all the parts cost, but just go to one of the PC computer shows and you can certainly price a comparable system very quickly.

>   I know my BIOS would balk right away at no display and keyboard, but
>I was wondering if anyone had tried such a configuration?

My BIOS doesn't balk, as long as I set up the config switches properly. My system does have a display adaptor, monitor and keyboard mainly because I already had them sitting around, but the system will run just fine if I disconnect them.

Fine. My code is freely available to any and all hams. It's mostly in C and should be reasonably easy to port, assuming you can cram what currently takes 277K on the PC (not counting data space) into 64K (counting data space). Consider also that most Z-80 C compilers seem to generate object code that's roughly twice as large as on the 8086.

Have at it!

***** 50 cent buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

SPRING FLEA AT MIT
Sunday, April 15, 1989
9AM-4PM

Come to the city for a great flea - plenty of free parking.

MIT's semi-annual electronics and ham radio
flea will take place on the Sunday of Patriot's
Day weekend again this year.

There is tailgate space for over 200 sellers and
free, off-street parking for 1000 cars!

Buyers admission is $1.50 (you get 50c off if
you're lucky enough to have a copy of our add)
and sellers spaces are $6.00-each at the gate

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 4PM, with sellers set-up
time starting at 7AM. Have no fear of rain, a
covered tailgate area is available (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)

For more info / advanced reservations 617 253 3776

What's going on with the packet presentations this year at Trenton Computer
Festival?

I think the site has changed, I've been told the festival is going to be at
Mercer County Commmunity College. Can anyone verify this?

Thanks, in advance!

     I would like to join the serial ports of several computers together
so I can run KA9Qs SLIP between then. Sort of poor man's Ethernet. I
know that a similar trick is used to join several TNCs together for
multi NET-ROM use. The trick involves resistors and diodes I believe.

     Does anyone have details on how to daisy-chain RS-232 ports?

Yours in eager anticipation

At the risk of Flames, another alternative is to have a master station,
and *poll*. I know this imposes the requirement of a master (build
two if your worried about single point of failure), but masters have
worked pretty well for the voice FM repeater crowd.

Consider construction of a cell of users (this scales nicely, in either
direction) that have a master. The master polls each member of the
cell. The master would also have links (preferrably pt-pt) going to
other cells. This way, a master could be moving traffic in and out
of a cell duplexed with intra-cell traffic.

Herewith follows my opinion on the so-called "NO CODE LICENSE"

In the beginning there was spark gap and CW, or to be more correct interrupted continuous wave (ICW). Therefore there was a need to test would-be amateur radio operators in rules, regulations, *AND* operating proficiency in ICW.

This is 1990. We have not only ICW available, but also AM, FM, SSB, NBFM, RTTY, PACKET, MCW, etc., etc.

Therefore, I propose that the amateur bands be broken up into exclusive segments for each mode of operation. No longer will CW be allowed anywhere in a band.

I also propose, that the would-be amateur radio operator be required to take a test for *HIS* mode of operation in addition to the required test in rules and regulations.

Call signs would be issued based on the mode of operation in order to police the bands. i.e. PA3xxxx for Packet License in the 3rd call area. CW3xxxx for CW License in the 3rd call area. etc. The prefix would designate the mode of operation. Naturally to avoid confusion with calls of other countries a complete world-wide re-issuance of call signs would be needed.

I think this would appease those who claim "my call is like my name, I don't want to change it." (shades of incentive licensing). But, just think, if you operate three different modes, you'll have three different calls.....just like a - first name - middle name - and last name.

Note to possible ARRL officials:

Please consider the above when next attending a League policy meeting. Thank you.

I have exactly the same configuration. I burned TNC1KISS.MOT
into a prom (by itself), replaced the Prom in the HD4040, and
voila, first time. I didn't bother to hook up a terminal to
see what happened, just ran NET straight away. Note that
TNC1KISS and TNC1BOOT are different programs, you can't burn
them both into the same prom. TNC1KISS will 'come up' in KISS
mode, at 4800 baud I believe (link from the TNC->PC). You may
just have the speed wrong.
                                                -jcp-

PS: you are correct, NOVRAM is not used by TNC1KISS

To get really good spatial reuse, you'd have to reduce power A LOT.
In particular, it's worth noting that cellular systems RARELY reuse
the 'setup' channels between cells, (there are like 30-40 of these
per carrier). The voice channels are reused, because many cells
have sectorized antenna systems, and you know which sector the mobile
is in.

If you had a bunch of linked packet stations, accessing one database,
then you'd pretty much have to use geography, and use of different

frequencies by adjacent 'cells' to allow sufficient reuse to make
it worthwhile. Also, the central node would have to FORCE the
connection to be handled by the nearest node on the frequency, which
is a bit beyond the concepts we have installed now. I can think of
situations where this would work well, and also really pathological
ones. (One of the most pathological cell systems is Los Angeles, where
most of the cells can 'hear' each other). Chicago was the first really
hard one (its really flat).

I'm sure a lot of queuing theory models have been done of the cellular
system, but it has the advantage of being able to 'park' your connection
onto a different channel than you make the initial contact on. Perhaps this
would be a useful feature for a 'packet radio?'.

Very few cellular systems out their actually implement power cutbacks, (at
least two years ago this was true on the east coast). My cellphone had
'diagnostic mode' where you could see all this, and you practically had to
be on top of the cell site (100-200 meters) before it would cut power. This
was Bell Atlantic and Cell One in Baltimore, DC, New York, and Phila.

some kind of non flame here:
what you described is exactly how some satellite uplinks for mobile
stations are working to avoid collisions.
And if the 'poll' is encapsulated inside of the regular
frame this principle would not even avoid additional overhead it will
avoid some empty ACK frames which would have to be sent otherwise.

Some nice description about this could be found in

   IEEE journal on selected areas on communication

of the preveous years.

An adaption to AX.25 of this access method (DAMA) was described in last
year's proceedings of the ARRL's meeting.

If the neccessity of a master is just a pain or the strongest success
is mostly a problem of your point of view. If a cellular backbone network
is build (using exclusive links on dedicated freqs) a master station
for all uplinks is neccessary anyway. So there are good reasons
to manage the channel access by this station|

Some ideas about other collision avoidance technics.

A full-duplex channel does not avoid collisions, it just reduces them
somewhat. The dead-time-clobbering effect could not be solved this way.
And there are other problems. But it wastes bandwidth.

Transposing APPLE's localtalk to PR could help a little bit but doesn't
solve the problem in general. Because no station can make shure to
get it's RTS frame through and no CTS sending station can make shure
to stop ALL other stations if some are hidden related to the CTS sending
station. Only a master station up on a hill has a chance to be heard by
all others.
I guess Localtalk wasn't designed to solve hidden station problems
(there are no hidden stations on a wire). So transposing this method
to PR wouldn't bring us a general solution. But it will bring us another
protocol which would be incompatible to AX.25

>> the point.
>
>Because I own a CP/M box.

Great! So do I... anyone want to buy an Ampro Little Board?

>Because I like to see how how much can be done with 64k and 4MHz.

Great! Take Phil's current sources and go for it! The CP/M world will
revere you...

>Because I don't like 80xx boxes.

None of us do, when compared to workstations. When compared to CP/M boxes,
you're at least two-sigma from the norm.

>Because I feel like it.

Great! Take Phil's current sources and go for it! The CP/M world will
revere you...

>Because this is a hobby and economic justification is irrelevant.

Agreed. But given the choice of writing for an inefficient cpu with 64k of
code space, or a slightly less inefficient (but still nasty) cpu with 640k
of space, which would you rather do? It's clear that Phil goes for the latter.
It's clear that you prefer the former... great, the world is big enough for
both of you...

If your environment is really that great, and you enjoy it that much, and
you want Phil's code to run in it... noone is stopping you!

Snarfed from Compu$erve:

#: 13398 S9/Packet Radio
    04-Apr-90 20:39:47
Sb: Trenton Packet Meeting
Fm: Jon Pearce, WB2MNF 70206,421
To: All

Arrangements are being finalized for the packet radio seminar to be held at
the Trenton Computerfest on April 21. This year the 'fest will be held at
Mercer County College, since the load became too great for Trenton State.
Since we're going to be in new facilities we've scaled down the formal
presentations to allow more informal communications, side meetings, and
flea-marketing. The topic schedule and preliminary time slots are as follows:

   Digital Signal Processing (DSP) - 10:00 to 11:00 by N4HY and friends
   Working the Digital Satellites - 12:00 to 1:00 by WB2MNF
   Setting Up Your TCP/IP Station - 2:00 to 3:00

This should give you a chance to hear about the NEW advances in DSP - several
manufacturers will have DSP boards on display at Dayton, and this technology
promises to touch virtually EVERY digital communication mode. Hear N4HY tell
how he used DSP and a Commodore 64 at work to decode the digital signals in
"Star Trek IV" (I THINK it was a C64 - I remember that it started with a "C").

This was an astonishing year for amateur satellites with SEVEN new birds
launched since new years. WB2MNF has been active on most of the new
satellites and will present an overview of the satellites, how you can use
them, and what you need to work them.

TCP/IP has been presented at several TCF meetings; however mostly at a
theoretical and developmental level. This seminar will discuss the procedures
that you need to follow to get a station on the air - the meanings of the
commands, proper station configuration, etc. The speaker team is being
assembled.

The meetings will be in Room 210 of the Math and Science Building. A talk-in
frequency will be announced later.

Further information will follow. Hope to see you there.

Jon Pearce, WB2MNF@WB2MNF

>Perhaps I'm missing something, but this seems like a text-book answer
>to my question that just *can't* work in the real world.

Depends entirely on what you stipulate as "the real world".

>Isn't the entire "Local Area Network" a form of clustering?
>If the addresses weren't "clustered" (maybe the problem is that I'm just
>using the wrong word), then connecting to 129.21.201.2 (my machine) would be
>a confusing thing to do: the first few bits wouldn't select Nysernet,
>and the next few bits wouldn't specify WHERE in Nysernet, and the
>next few bits wouldn't specify which LAN within RIT, etc.

You're missing my point. Yes, in practice, is is *wonderful* that addresses
have been assigned in a heirarchical fashion, and that routers typically are
smart enough to recognize that and take advantage of the fact to minimize the
size of their routing tables. But, there is no requirement other than
administrative/efficiency that it be done this way.

>Maybe part of the confusion is that on packet, we don't have any
>have dedicated IP routers (yet!). When they come, and when we have
>a "backbone" net spanning the globe, the LAN concept will become
>**crucial**.

Some of us do have dedicated IP routers on packet. That's not relevant, except in that we tend to make them resource starved enough that we discover the benefits of "efficiency hacks" like clustering *very* quickly.

I wish I really believed that amateur packet radio will really have globe-spanning IP backbones within my lifetime. If I didn't think it was possible, I wouldn't work so hard to try and see it happen... but...

>The only work comes in giving them information to
>translate your hostname into an address, and in modifying tables
>each time a new LAN is brought into the network. How can this
>work without heirarchal clustering of addresses?

I object strenuously to the notion that someone needs to some something manually just because another subnet gets added. Maybe you didn't mean that, but you seemed to imply it. Good routing software will include the ability to recognize and propagate routing information as the topology of an Internet changes.

>Please tell me if I'm all wet here (no offense will be taken - aren't
>we all still learning, after all? :-))

No, you're not wet at all. I think we just disagree on what I perceive as a need to differentiate between what is intrinsically required to make something work, and what is forced by constraints on resources. I see clustering as a textbook case of the latter.

I've set up NET over a KISS TNC (MFJ-1274) .
Throughput on FTP seems slow.
Often I get the message "AX25 Receive:"
              "Bad Header!"

              Any idea what this is?
I'm digipeating through a NETROM node to the only other two stations
running NET. This happens most often right after my TNC has
transmitted, which makes me wonder if the digipeater is transmitting
my packet before my TNC/radio is ready to receive.
This happens with ka9q 881225 and pe1chl/ka9q 871225.12.

Related question maybe: Anyone have a list of what the tnc parameters
are, and suggested ranges? The documentation is sketchy on them.
Thanks.....

Perhaps because it's a well known BAD idea. It "works" when loads
are light or the traffic patterns happen to work out in your favor.
As soon as they don't, you get into a state where you have to free up
a buffer to be able to accept a message from the digi next to you,
but you can't free up a buffer because that digi is also short on
buffers and can't accept your message right now.

This is called a "store and forward deadlock". There are various
ways to fix it.

1. Toss a message when things get congested. That's the "connectionless"
   (IP style) solution. It works well, but if you do that you CAN'T
   fake the ACKs, since then you would break the next layer up.

2. Guarantee that there are enough buffers. This can be done in
   connection oriented (X.25 style) cases. What you described isn't
   since there is no digi level flow control. In any case, this approach
   requires "pessimistic" allocation of resources: you have to allocate
   buffers for the worst case or you haven't done anything at all. Given

typical bursty traffic, the average case buffer load is a very small
fraction of the worst case. In other words, this solution is very
wasteful of memory. It may be wasteful of bandwidth if you end up
running with a smaller "transmit window" (number of packets in transit)
than would otherwise be necessary.

The message "Bad Header!" from NET (I assume you have trace turned on)
means exactly what it says: that the host computer received a frame
from the TNC that has a bad AX.25 header. This is usually due to character
loss in the link between the TNC and the host computer. There is no
flow control in the KISS TNC protocol, so this problem can happen if you
run the link too fast. Try slowing it down to 4800 or 2400 baud.

NO! NO! A THOUSAND TIMES NO!

NO! NO! A THOUSAND TIMES NO!

NO! NO! A THOUSAND TIMES NO!

Yes, I'm SHOUTING and repeating myself. There was a "chain letter"
to this effect in MANY newsgroups a couple of months ago. It is
ABSOLUTELY FALSE. The FCC had considered something that vaguely
resembled it a couple of years ago, but those commissioners are GONE
and the new FCC is NOT interested in it. Period. BTW, if you can
get comp.dcom.telecom, do check it out; I think somebody this week
had a posting that had the FCC's written reply to a query on the
topic.

Just being Rumor Control Central -- again.

I'm posting this in case it helps someone else:

I posted a request for help:

>Often I get the message "AX25 Receive:"
>   "Bad Header!"

Two responses helped me solve the problem:

From Phil Karn ka9q:

The message "Bad Header!" from NET (I assume you have trace turned on)
means exactly what it says: that the host computer received a frame
from the TNC that has a bad AX.25 header. This is usually due to character
loss in the link between the TNC and the host computer. There is no
flow control in the KISS TNC protocol, so this problem can happen if you
run the link too fast. Try slowing it down to 4800 or 2400 baud.

Phil

And from James Dugal n5knx:

I've seen this happen in two situations:
1. Running DoubleDos with a 4.77 MHz PC, with trace enabled, and the
     serial port to the tnc running at 9600 baud. It can't keep up
     with the data coming in, and the dropped chars yield a bad packet.

2. Somehow my transmitted packets seem to be heard by the TNC (a 1274 also)

particularly when I use an indoor antenna and perhaps a too-wide deviation
(I have to adjust the mike gain downward for packet). But the heard packet
is not perfect, leading to error msgs in the trace.

73 & good luck,
-- James

I cranked down the audio output of my TNC (R76 - It's a many-turn pot
(50???) (on a MFJ-1274)) and that seems to have solved the problem.
I still have other problems, but.......

Thanks.............Geoff

Please take note of your source of this false rumor, and remember not
to believe anything that comes from this source ever again, unless you
can determine that they obtained it from a bad source, recursively.

You can see how rumors get started and keep on going. It is a good
thing you came here and asked us about it. There was a hint by the
FCC of doing something like this quite a long time ago, and some
people told the FCC, or at least they figured it out, that this was
not a good idea. It has been suggested, but I've seen no evidence
of it, that the phone companies are propogating this rumor to get
the FCC angry at modem users.

If you are going to try to develop a 'bomb-proof' protocol with a form of error
correction you might want to think about using a Reed-Solomon code combined
with the bit-shuffling you describe. This can give exceptional performance.
I think it is possible to use a normal CPU to do the decoding at the low
speeds on amateur radio. (RS code is the one used in compact disk players and
many satellite communication links)

>It seems like the poor characteristics of HF packet could be improved with

>of the channel and leave the rest of the protocol (ACKs, etc) intact. Of

>course this would amount to the use of a non standard alphabet, so I guess
>that for HF this will have to remain hopeful musing. Maybe it would be useful
>for high speed UHF packet?

If such a mode would come into common use on UHF authority to use it on HF would
not be impossible to get, I suppose. There probably is a (proposed) standard
somewhere for this kind of FEC protocol. A standard would be advantageous
in getting the thing accepted by the licensing authority.

While I have some experience with AX.25 packet radio, I am somewhat
confused by TCP/IP packet radio. As I understand it, my KAM can be
operated in KISS mode under the control of TCP/IP software running in
my PC. The "IP" part of this seems straight forward; active "nodes"
simply exchange IP packets (datagrams?). It's the "TCP" part that
confuses me.

A computer host based TCP/IP network (eg. Internet) provides Telnet,
FTP, and SMTP services. Strictly speaking I believe there are client
and server parts to each of these TCP services. My host computer talks
to some remote host, via IP, and establishes client/server virtual
sessions to accomodate my FTP or Telnet requests (is this in fact
true?). However, in the case of SMTP mail, I edit my message and pass
it to a mailer service (I'm a VM/CMS user) which somehow uses SMTP to
route my mail around the network.

So it seems to me that the TCP facilities: Telnet, FTP, SMTP, are very
bulletin board like. How does one originate and receive mail over a
TCP/IP packet radio network? If I ran something like the KA9Q NOS in
my PC would I also get, essentially, a packet BBS as part of the
package?

Any comments will be very welcome. Thanks.

Could someone please tell me what is the latest version of the TCP/IP
code that runs on an IBM PC clone under DOS. I would like to get up and
running, but all I can find is an old 2-87 version of the "ka9q net" code.

Is net still the package of choice, or is NOS a replacement for it. I do
not use OS/2, just MSDOS 3.3. Where do I get a current copy of the
code/source and an IP address.

Thanks,
Mark

In article <1200@kunivv1.sci.kun.nl> ge@kunivv1.sci.kun.nl (Ge' Weijers) writes:
+---------------
| If you are going to try to develop a 'bomb-proof' protocol with a form of
| error correction you might want to think about using a Reed-Solomon code
| combined with the bit-shuffling you describe. This can give exceptional
| performance. I think it is possible to use a normal CPU to do the decoding
| at the low speeds on amateur radio. (RS code is the one used in compact disk
| players and many satellite communication links)
+---------------

There is a very simple R-S code which can be done fairly easily in software.
The (255,252) code sends 3 bytes of checksum for each 252 bytes of data. It
will correct any single byte in error, and detect any two bytes in error.
If you use another 4 bytes (taken from the data field) for a CRC-32, you

get a *much* lower chance of miscorrection, and can even drop back to the single-detect/correct (255,253) code (which, because of the CRC-32, really has become a (255,249) hybrid code). The following is a sketchy (and somewhat innaccurate) look at what it takes:

For the R-S code, you need two tables of 256 bytes, and one of 64k bytes. The first table provides for multiplication by a fixed primitive polynomial in GF(256), the second supplies multiplicative inverses, and the big table does general multiply for two GF(256) values. (You also need a 256 word or 1024 byte table for the CRC-32). For each byte sent, you have to do the following at the transmitter and receiver:

```
c0 ^= data[i];                /* "multiply" by alpha**0 and accum */
c1 = mul_by_alpha_tbl[c1] ^ data[i]; /* multiply by alpha and accum */

crc32 = (crc32 << 8) ^ crc32_tbl[(crc32 >>24) ^ data[i]]; /* CRC-32 */
```

Then at the receiver, after receiving the packet, you check the crc32 for being the received CRC. If equal, o.k. Alternatively, you check for both c0 & c1 being zero (including accumulating the incoming checksums.) If not, Then the byte in error is given by c1/c0 -- in GF(256) arithmetic, which is:

```
errpos = mul_tbl[c1, inv_tbl[c0]];
```

And the error value is just c0, so the correctin becomes:

```
data[errpos] ^= c0;
```

Again, I've left out lots of details, but the above *does* give a close order of magnitude for the CPU work needed, namely, a couple of table-lookups and a couple of XORs per byte.

-Rob

p.s. If you skip the CRC-32 but use the full (255,252), you have to add another 256-byte table for multiplying by alpha**(-1), and a new checksum byte with the following line replacing the CRC-32 line above:

```
cM1 = mul_by_alpha_M1_tbl[c1] ^ data[i]; /* multiply by alpha**(-1) */
```

You get about a CRC-16's worth of protection against mis-correction.

NOS development continues. The latest experimental version is kept on
flash.bellcore.com in /pub/ka9q/src.arc (sources) and net.exe (executable).

Unfortunately I just haven't had the time to finish updating the
documentation, so you'll have to figure out the differences either by
reading the source (which IS well commented) or reading my notes to
the tcp-group mailing list archives on ucsd.edu in /mailarchives/tcp-group*

Can someone give me some good literature references for learning about how
various error CORRECTION codes work. My knowledge begins with the basic
4/3 hamming code, and my curiousity goes to and beyond what is used on CD's.
Purely research only references probably won't help right now.
Thanks.

NO! NO! NO! (this is not a flame)

The FCC is NOT considering a special tax for using modems on telephone lines. A couple of years back there was talk of applying the same network access charges to data networks that the long distance voice networks have paid since divestiture, but it got killed.

This rumor keeps coming up....it was flying all over the packet and landline BBS networks AGAIN a few months ago.

Again, it is NOT true.

+---------------

Here's my personal list:

        - Hamming's little intro book (small blue hardback, I forget the title)
        - Berlekamp, "Algebraic Coding Theory", (Aegean Park Press)
        - Costello & Liu, "An Introduction to Error Correcting Codes" (?)
    - Peterson & Weldon, "Error Correcting Codes"
    - Blahut, "Theory and Practice of Error Control Codes"

Hamming's little book is an easy start, but only goes through single-error
correction. Costello & Liu (or Liu & Costello?) is a pretty good cross-section.
And if you get *really* serious, try Berlekamp's "Algebraic Coding Theory"
(Aegean Park Press, L.A., CA) which is considered the "classic" text. I've
read the others, but those three seem to span most of what one would want
to know. Unfortunately, you really do have to get hip-deep into the theory
in order to write practical applications. Oh, and somebody just told me about:

    - Arazi, "Commonsense Approach to the Theory of Error Correcting Codes"
      (MIT Press)

The person said it had a good writeup of the general solution for the special
case of RS(2^n-1, 2^n-3) codes [of which the (255,253) code I mentioned is
an instance], with nice diagrams, worked out examples for both decoding &
encoding, and the underlying mathematics. I haven't gotten a copy yet, so
I can't say firsthand...

Two quick questions (probably with no quick answers).

(1) I have recently purchased a PK232MBX and wonder if anyone knows of any mods for it.

(2) I need the format of WEFAX transmissions so that I can write a converter for High-resolution graphics cards (Targa and Vista).

Please e-mail me any references. Thanks! uunet!epicb!david

Howdy:

I (FINALLY) got my copy of QEX today (not their fault, I waited until the last possible second to renew just like always) and read McClarnon's (VE3JF) article, "More Ideas for a Robust HF Packet Signal Design". I have just a couple of comments:

HIP HIP HURRAY. HIP HIP HURRAY. Sanity at last. Barry just moved to the top of the list to test DSP modems built by yours truly for HF.

If you want to read a couple of sane articles about HF, I suggest you get a copy of the March 1990, QEX and his earlier article in QEX in December 1987. A relevant article is done by Allan Kaplan, W1AEL, and is a nice thought provoking piece, even though I came to the same conclusions Barry did. You may find Kaplan's article in the November 1989 issue of QEX. It appears that QEX is providing a useful forum for discussion of HF modems/protocols. I will describe my work there in order to fulfill a (two year old) promise to Rinaldo. What Barry describes as his `ideal modem', one which does multiple bits/baud and the baud rate is 75 baud, is exactly what I have done and the first report was given at DATASPACE 1989, last July in Guildford, University of Surrey, England. There were few details and now that I have actual `tnc hardware/software' to hook it to, the testing should proceed at an accelerated pace.

At the moment, I am really busy adding satellite modems, and other `required' modems (Why do I need to add THIRTY different tone pairs for a single HF FSK modem?). I'm also hacking a modified duobinary partial response at 4800 baud (a sane approach to going faster with existing FM radios, No DC and no excess bandwidth), and other goodies (all the usual HF WEFAX, AMTOR etc.)

I hope to see many of you hams at Dayton and to show you all of the wonderful toys during either my packet or satellite talk.

Once again, I recommend Barry's work/papers highly.

It seems to me that the much-quoted fully-loaded Aloha channel efficiency
of 18.4% is based on the assumption that if two stations transmit at the
same time, neither gets through. In fact, on FM channels, one station
will often make it because of the capture effect.

How much stronger does a signal have to be to capture another? And how
much does this improve the Aloha figure, if at all?

Having seen inquiries about W9NK's (Dan Frank) implementation of NETROM for KA9Q's TCP/IP package, I have this to offer.. As I recall, I have a file on my work system, pgd.adp.wisc.edu 128.104.198.22, which is called NRMAN.txt. In there, Dan says that if you REALLY want the best details on his Netrom implementation/emulation, you should order copies of the ARRL Computer Networking Conference papers (there are papers submitted for each years conferences).. Anyway, in the 87 or 88 papers (from ARRL) is Dan's expose' on IP over Netrom.. I'll bet that the ARRL will still sell you copies of all that good stuff! I hope I have not DUPLICATED somone else's posting on this..... I have been tooo busy to read all my E-mail :-).. Anyway, the papers are no doubt worth their weight in gold, considering the various authors.. Wish I had some myself!
At least *I* get to visit W9NK in person once in a while.. I always learn somthing when I do.

Enjoy, Pat--KD9UU

All TNCs that I know of have came with some form of carrier detection. The
problem is that many such circuits are not very reliable, particularly those
that simply look for energy in the channel. The better carrier detect
circuits look for something more closely resembling an actual data signal,
thereby making them much less susceptible to falsing by background noise.

A carrier detect circuit is not necessary to make the receiver work. With
any TNC, you can simply open the squelch and feed the random noise into the
receiver. When a valid frame arrives, the TNC will decode it. The carrier
detect circuit is needed to inhibit the transmitter when another station is
already using the channel.

Please tell me WHAT EXACTLY or at least a good approximation of ... ham-radio.packet is???!!! I have been reading a bit lately and have a rough idea of what your talking about.. I understand and know what TCP/IP is and satellites, and I know what ham-radio is but... what's the packet deal? Please tell me I think I found another hobby I can't afford :-)

thanks

I'm writing this msg. at a normal telephone BBS. But I'm intrested in how Packet Radio works. What kind of equipment do you need? What would be the average cost? Also, what kind of license (if any) do you need? Are BBS's for the Packet Radio more or less like normal phone BBS's? By that, I mean the layout, entering msgs and downloading etc. Hope to here from anyone who has a Packet Radio soon.

In all of the ARRL computer networking conferences, I have not been
able to find much of a description of the level three net/rom
protocol. Is this in fact documented anywhere, or is my only option
to pull apart a two-inch stack of code written in German?

(Yes, I want to do some net/rom applications developement - call me
crazy.)

Chris

I am the IP Address Coordinator for Arizona (44.124) ... we are in the process
of restructuring the numbering assignments here, and I was curious to hear
from other IP coordinators on how they make assignments in their states.

Is assignments being made based on geography, frequency, etc?

Thanks and 73,

David WB7TPY

FM threshold is commonly quoted as being 10 dB C/N but it may depend
upon the particular detector. In addition, my experience in watching
1200 baud AFSK leads me to think that something nearer 20 dB may be

required before things stop improving. It's probably safe to guess that
a signal 20 dB larger than another will effectively capture it, a signal
only 10 dB stronger might not for typical amateur packet situations.

>What do I need to set up a station running net.exe at 56kbit ???

Currently, the best combination I've seen is a PC or AT clone, with a DRSI PCPA card, cabled directly to a WA4DSY modem. That, and net.exe, and you're golden.

The PCPA is a "dumb" 8530-based card for the PC. K3MC's Awesome I/O Card is almost available from DRSI, when it is, it'll be the preferred interface card for cost and performance at 56kb kinds of speeds in a PC.

Correct.

>The "IP" part of this seems straight forward; active "nodes"
>simply exchange IP packets (datagrams?).

Yes. IP is sort of like AX.25, in that it is simply the definition of the packet format that will be used for communication between multiple hosts. In particular, it has a source and destination address, and contains some amount of data.

>It's the "TCP" part that confuses me.

TCP is a protocol that "rides on top" of IP, and provides a connection-oriented facility. We speak of IP datagrams as individual entities, we speak of TCP connections. TCP works by defining a header and a trailer that take the first few and last few bytes of the data in an IP frame. Like:

```
     | ip header | tcp header | data | tcp trailer | ip trailer |
             |- - - - - the tcp packet - - - - |
        |- - - - - - - - - - -  the ip packet - - - - - - - - - - -|
```

>A computer host based TCP/IP network (eg. Internet) provides Telnet,
>FTP, and SMTP services. Strictly speaking I believe there are client
>and server parts to each of these TCP services. My host computer talks
>to some remote host, via IP, and establishes client/server virtual
>sessions to accomodate my FTP or Telnet requests (is this in fact
>true?). However, in the case of SMTP mail, I edit my message and pass
>it to a mailer service (I'm a VM/CMS user) which somehow uses SMTP to
>route my mail around the network.

Yes. This is fairly accurate. SMTP is a protocol, like FTP and Telnet. The problem is that with FTP and Telnet, there are programs of the same name that implement the protocols, which is confusing. With SMTP, there's usually some "mail delivery agent", or background process, that takes care of moving mail from your system to another system. There is a separate "mail user agent" that implements that actual user interface for mail. The user and delivery agents typically communicate through spool and mailbox directories. With the KA9Q package, the BM mailer is one example of the mail user agent, and there is a mail delivery agent wrapped inside NET.

>So it seems to me that the TCP facilities: Telnet, FTP, SMTP, are very
>bulletin board like. How does one originate and receive mail over a
>TCP/IP packet radio network? If I ran something like the KA9Q NOS in
>my PC would I also get, essentially, a packet BBS as part of the
>package?

If you think of a BBS as being a host that provides certain connection oriented services, then a system running the KA9Q package and allowing FTP, Telnet, and SMTP certainly fits the same model. However, you really get more than that. Because of the way the IP protocol family works, you can also provide services that are not connection oriented, it's trivial to support multiple simultaneous activities, you're not restricted to just packet radio links, it's not hard to write new applications, sourcecode is freely available, etc etc etc.

Hope that helps.

Well, you have purchased a very wonderful piece of equipment. Clean all
the mess off of it (I'm assuming you bought one of the FAA surplus
models?), buy the maintenance manual for it, and look carefully at how
it is constructed. This is how electronic things are built when
maximizing profit through minimizing the production costs is not the
primary goal. I think you could mount it on a truck and drive around
with it running and it would still record. Well, probably not really,

the loop electrode assembly would bounce around. It is really easy to maintain, too, and its principles of operation are both easy to understand, and somewhat amazing -- it's the first place I ever encountered a "sample and hold" circuit... since it is built in discrete components rather than on an IC, you can see how it works. It's fairly amazing the way it captures the voltage at the peaks of the AM carrier cycles on a small capacitor between two MOS FETs. The only problem is moving it... when I moved to a new location awhile back, the mover threatened to quit when they saw the equipment because they didn't want to carry it down the stairs, it's so heavy.

If you're buying the replacement parts (you have to replace the loop and blade electrodes regularly, plus other parts that occasionally wear out, and also buy the wet electrolytic paper for it) from someone other than Alden, write to the address that's on the chassis and ask for pricing information. You might ask for the original advertising information on the recorder, too... it's interesting how expensive the optional parts are, new. I'm not sure how much the recorders sell for, new, but Alden still sells them.

>Nonetheless we have never seen anything printed in the fax machine except
>black lines.

Yes, it only has an AM demodulator in there unless you have a special model. I posted detailed design information for an FM demodulator *specifically* for the Alden 9231 about a year ago, which you need to demodulate the FM subcarrier that is transmitted on HF. You can receive pictures from the polar satellites, and from the GOES Tap if your have that, directly with the 9231, though, since that's what its demodulator is for. One problem is that the 9231 emits RF interference fairly strongly on 137.4 and 137.62 MHz, as well as random noise from the switching of the marking amp on and off. I wish it didn't since those are prime polar satellite frequencies, but I guess it passes the FCC emissions regulations, and it was actually made for use with leased wire services. I've never been able to figure out what causes the interference, but it comes from the master oscillator board, which runs at a much lower frequency. If you figure out how to reduce the RFI I'd be interested. One problem I found is that the signal input line goes directly past the power supply line to the marking amp (it's wrapped inside the same bundle of wires), which inductively picks up noise from the marking amplifier transistor turning on and off.

>   -- Is there a better way to receive weather pictures with different
>   gear? Is there a TNC and PC setup that might work better than
>   the paper based fax unit?

Yes. The best I've found is the A&A Engineering demodulator using a PC with a VGA, about $120 or so. There are commercial programs such as the Elmer Schwittek MultiFax software package you can use to display output from the A&A demodulator on the PC. These give photographic quality images, compared to the good but limited-contrast and limited-resolution images of the 9231. The 9231 is best for recording weather maps rather than satellite pictures.

>   -- What should the receiver bet set on? (AM, USB, LSB, CW)

For HF stations, set it on USB or LSB -- if you set it to the wrong sideband
you will get a negative image and will know you need to use the other (also
the recorder won't sync properly if you're using the wrong sideband).

For direct reception from the polar satellites, use FM, but you need a
WEFAX receiver for that. Despite what people say, other kinds of
receivers won't work very well... I've tried it. You get a picture but
with a lot of noise and poor grey scale. The WEFAX receivers are
relatively inexpensive compared to general-coverage receivers and
scanners.

>   -- Is a long wire good enough or do we need a beam or something?

Yes, a long wire is fine for HF. For VHF from the satellite, you need a
circularly-polarized antenna such as the WEFAXTENNA from Vanguard.

>Any assistance or help would be greatly appreciated. Earth Science won't
>let me walk down their hall until I get this thing working.

I hope the above will be of some help.

This weekend I finally got on TCP/IP based packet, but I tried to use a
version of NOS (900312), not NET. While I did get the code to compile
fine, I can not get the NOS code to be really useful. It will not
use the standard hosts.net file. In Phil's four page release notes he
does mention this. The replacement is the domain.txt file, however

no one I can find knows what one looks like. What is the format of
this file? Maybe a couple of example entries????? Without that
file NOS is crippled.

While looking at the source file files.c, I found that there appears to
be a dir for AX.25 mailbox help files. All the src.arc file contained was
sources and a makefile.   Are these files something I am missing from
a dist archive or are they something the user adds like the finger files?

Is /spool/areas a file or dir? If a file what is its format? If a dir am I
missing more files.

What does the /spool/rewrite file look like?

In config.h what do the options NRS, AXLINK, SCC, and SLFP add? I
turned on AXLINK . Its comment made it sounde useful, but what
do these four features add? With the lack of the domain file very
little could be tested.

I really like the new screen handling, features, and feel of NOS, but
no one in my area, SF Bay, seems to use NOS. In fact several people
got a little upset when I told them I was. So I'm now using a version
of NET, but I will change back the second I can get the domain/resolver
problem worked out.

Is BM still needed to read and send mail with NOS? Or is that now built-in.

Where can I find these missing files, formats, and any docs? I really
want to get NOS up and flying. What little I got working looked great.

After having tested around a bit with NET.EXE, I am also interested in

recompiling the sources of NET in order to include stuff of my own. I
intend to use Borland's Turbo C; however NET has been developped under
Microsoft C and therefore some problems occur when recompiling the sources.

1. Has anybody already done this? Hints? Pitfalls?

2. What memory model is required for NET? Should I use Large?

3. The files 'dirutil.c' and 'pcgen.c' are very system specific and need to
   be rewritten from scratch for Turbo C. Anybody has already done this?
   Anybody willing to share sources with me?

4. Assembled parts: Do they work with programs compiled under Turbo C? As far
   as I know Turbo C is sufficiently compatible with Microsoft C that it
   should work.

5. Assembler: All assembly routines require the file 'lmacros.h'. What is
   this? I cannot find such a file in my NET sources.

>I am the IP Address Coordinator for Arizona (44.124) ... we are in the process
>of restructuring the numbering assignments here, and I was curious to hear
>from other IP coordinators on how they make assignments in their states.

We split the address block into binary divisions along "RF boundaries". While this is not necessary, or in all cases advisable, in our area it has in fact simplified routing.

Each user is assigned a block of 4 addresses to start with, but they aren't told it's a block of 4. We give them the lowest address in the block, and if they ask for more, we give them another adjacent address. This way, a guy with an XT on the air full time and an AT a slip link away can be cluster routed by the local switch via his XT. A fairly common configuration here...

>Is assignments being made based on geography, frequency, etc?

Avoid geography unless you mean "RF geography". There isn't anything magic about living a town away if it's a direct RF path. In Colorado, we made a 3-way split early on between SE Colorado, NE Colorado, and the "western slope", on the west side of the Continental Divide. This makes sense, because there is an RF boundary between Colorado Springs and Denver, and pretty good connectivity Denver-north and Colorado Springs-south. Beyond that, additional subdivision has been pretty pointless.

While the stronger signal may well capture the detector will it be decoded
properly? If the weaker packet had already begun the receiving
TNC's state machine may not be able to synchronize with the new packet, and
both would be lost. Perhaps a quick-recovery decoder could be used,
but I don't believe the ones currently in use will often recover that fast.

Thank you for the response to the eralier USN packet message.

The issue driving potiential packet use on US Navy ships is the full range of user data services needed by supply and maintenance officers. Currently, critical repair items are documented in a narrative message form and sent out via the ship's radio room. This narrative message resembles a TELEX or teletype page. It is transmitted at 75 bits/second via the Navy Telecommunications Service. Well, that is painfully slow, compared with 300 or 1200 bits/second that may be achieved via HF long haul or VHF short haul.

There is a real change in attitudes within Navy circles today regarding innovative communications technology.

Aircraft carriers are now equiped with cellular telephones to extend the ship's pier side landllline an additional 25 - 50 miles while she is underway. Some carriers are also equiped with INMARSAT commercial satellite terminals that can use 9600 bits/second dial-up voice circuits. Ofcourse, both solutions cost in terms of paying for air time.

However, if reliable packet communications can be used to move the mountains of supply and maintenance data of mission support computer systems (no tactical or classified data) at no cost a significant cost / benefit arguement can be made for packet radio.

The key: reliable communications at a decent data rate, 300 or 120000. (that's 1200 not 120000, sorry).

The radio platforms are already in place for HF communications, an interface shall be built to link via RS-232 to a gateway PC.

Then there shall be the chore of I.P. addresses, etc.

That is a quick snap-shot of the situation today.

I can not figure out how to set the time zone in BM. One sample bm.rc file
had an entry "zone MST", however even the bm.exe packed with that bm.rc
wouldn't accept that entry. Using a binary file viewer on two versions
of bm.exe
didn't turn up anything like zone or timezone. I did find record, mbox,
screen,
reply, maxlet, folder, and mqueue, what are these used for? The BM version
is v3.3.1.5sac 881015.

I have also have found what I beleive is a bug. If the user selects f # to
forward a message, it seems to forward ok. However after that access
to all of the messages in that folder screw up.   Using h will still list
headers, but they are all blank! Using the message number or . to list
the text of a message just produces a few blank lines. It doesn't just affect
the forwarded message it gets them all.

It would also be nice to be able to add something to a forwarded message.
As it is now bm will not let you add anything to the message you are
forwarding. An explaination of why you are forwarding a message on to
someone is a common requirement, but it doesn't seem to allow that.

73,
Mark (still looking for NOS docs of any kind, please!)

The local (Phoenix) police and fire use some packet-like mode to communicate
with computers in the vehicles, and my PK-232 signal analysis mode is unable
to figure it out. I've also tried quite a few combinations manually, to no
avail.

Sounds like about 2400 baud, and it's bursty like packet.

If anyone else figured out what formats commercial systems use, could you
please post them or email them.

Thanks

Anyone planning to purchase an Orion antenna rotator? I suggest you wait
a while. I have been waiting for 6 months. The container was poorly
packed. Damage to rotator, control box and all hardware was scattered
amongst the popcorn. No schematic. No warranty card. No instructions
on calibrating the unit. They are sending me a new one. I would suggest
waiting for them to get their act together, shame too, it looks like a
well designed system!

>It would also be nice to be able to add something to a forwarded message.

BM uses the TZ MSDOS environment variable for timezone specification.
Put something like "set TZ=CST6" in your autoexec.bat.

Here's a way to send a msg on with comments: from within BM use
the m (mail) command to specify the recipient, then begin entering
the text that you desire to send. In column 1 enter ~m to insert the
body of the current message (the one you were reading and want to
forward). Terminate as usual with a period in column 1.
Type ~? for a list of ~-prefix commands.

  My understanding is that a TNC keys up the transmitter and sends a stream of HDLC flags for a short time, to allow all the pieces of the chain to start doing their jobs (i.e. transmitter actually start transmitting, receiver start receiving, TNC to "lock up" on the bit stream). These flags will, I believe, terminate the weaker frame prematurely and then start a new one. I would tend to believe that most TNCs would throw away the interrupted frame and start on the new one. Chips like the ubiquitous Z8530 do this pretty rapidly I believe. The interrupted packet would look like a packet with a bad FCS (frame check sum).

   I would appreciate further input on this myself - I'm building a TNC right now (hardware looks complete, time for firmware) and this sort of thing is useful (the TNC is not a kit, my own design).

If these were commercial antennas, I would advise you to contact the
manufacturer. They should have this information.

Since these antennas are probably home-made, I would recommend that you
check out some of the articles published in the literature. You should
be able to find two or three good articles in Ham Radio Magazine, from
the middle 80's. Unfortunately, my mags are 2600 miles away, so I can't
give you a better reference.

You didn't say if you wanted to stack them in the E-plane or the
H-plane.

More info about stacking antennas:

The stacking distance strongly depends upon the gain of the antennas.

You also didn't specify what you were looking for. Do you want maximum
gain? Do you want a clean pattern? In which plane?

In general, I usually recommend stacking at just a short distance less
than the max_gain_distance. This will reduce the gain only marginally,
but clean up the pattern significantly. Sorry, but my literature is
2600 miles away, so I can't give any quantitative information.

My copy of Hamming's little book is called:

  Coding and Information Theory
      by Richard W. Hamming
      Publised by Prentice-Hall, Inc.
      ISBN 0-13-139139-9

This is an EXCELLENT book on coding and information theory.

There is something new with good old TheNet:

                     TheNetNode

                    by NORD><LINK

This new Version runs entirely inside a PC or Atari computer and uses
TNC2s with a special KISS Eprom as an "intelligent interface".

New features are:
 - up to 255 Channels on one Computer
 - Call forwarding (just connect MYBOX, the node will know what call
   to connect you with and how to get there. If a BBS is down the sysop
   may set a route to an adjacent box.
 - Converse Mode
 - Monitor Heard list
 - Help system expandable by sysop
 - Software updating thru radio
 - Watchdog hardware for TNC and Computer (simple)

- Sysop has full remote access do DOS
- sophisticated statistics done for every channel (quality, thruput, etc)
- written in C (we use Turbo-C 2.0)
- TNC-KISS firmware with TOKEN-RING protocol

Hardware? Only standard items (plus simple watchdog). The PC and all TNCs are connected together in a token ring. If a TNC fails the watchdog will close the ring around it and reset the hardware. If the TNC comes up again it is recognized automatically and put into service. If the computer fails it is rebooted. You may omit the watchdog circuitry but if one TNC catched a bit flu it could break the whole ring.

Status? Ready. The circuit diagram for the watchdog comes on a distribution disk (print it on any EPSON printer).

Problems? We don't count them. The manual is not ready yet. The german version is done right now. Translation to english has to be done next (anybody willing to do that job?).

Here is a short command overview (some are for the sysop only, more to come):

```
AKTUELL:   gives you actual news for the digi
BEACON:    all around the baecon
BCNODES:   to send the beacon across "not TheNet nodes"
CLEAR:     clear statistics
CONNECT:   make a connection
CONVERS:   enter converse mode, same as TheNet 1.1C
CQ:        call cq
CTEXT:     signon message on connect
DISABLE:   disable a channel
DOS:       prefix for DOS commands
EDIT:      enter a message text
ENABLE:    enable a channel
HARDWARE:  gives a hardware description of the node
HELP:      gives a help info
INFO:      gives general information
IO:        controls bits of the printer port (e.g. antenna switching)
LINKS:     for connects across special "not TheNet nodes"
LOAD:      upload a file on the node's disk
MAP:       gives a small map of all the neighbours
MHEARD:    tells you who was heard when on what channel
NODES:     tells you all the known nodes
PARAMETER: read/modify parameters
PROMPT:    modify prompt
QUIT:      disconect from this node (see below for details)
READ:      read an ASCII file from the node's disk
RESET:     force a reboot for the node
ROUTES:    sets/tells all existing routes
SOFTWARE:  gives a software description
STAT:      read statistics
START:     start a program on the node
SUSPEND:   for the bad guys
```

SYSOP: verify a sysop
SYSPRO: sysop logfile
TEST: xmit test pattern on a port for alignment (from remote|)
TIME: what time is it
USER: who is on this node
VERSION: what version is this node

TheNetNode features reconnect. If the station called by you disconnects
you will find yourself reconnected to the remote node's command processor. If
the station that initiated the connect disconnects, the whole link will be
disconnected. If you connect node A and from there node B and from there
node C, and then issue a QUIT you will be reconnected to the command
processor of B, if you QUIT again you will be at A again (the next quit then
will disconnect you from A). So you may snoop thru a net and go from here
to there without rebuilding the whole link again. If digis of other types
are involved in the link, the reconnect will end up at the last TheNetNode
connected. Reconnect is not available for standard TheNet now.

After all TheNetNode is fully compatible to TheNet. It works together
with any other TheNet neighbour node without any restrictions. But the
full features are only available on the new version (of course).

And there are more features to come. But because everything is written in
Turbo-C the software may be modified on your own computer, test it and
upload it to your node. If you put your linker on the node's disk you may
even upload just one module and start a link from remote thru the DOS gate.

The current release for the PC version is 1.22. It's running here on
several sites since some weeks without problems so far. So we decided
to declare the beta test passed (still waiting for the ultimate bug).
But if you'd prefer a 680*0 TheNetNode is for you too. An ATARI-ST
version is available with identical features.

Interested? More details will be available soon.

Hmmm. Nice to see a fellow UHF guy on the net, almost within reach without having
to use the moon ...

Lets see, 3m boom is somewhat more than 4 wavelengths. The antennae thus are quite long.
The usual recommendation if optimizing for gain is 2-2.5 wavelengths which means
1.4 - 2 metres apart. Omtimizing for space (communication) suggests smaller spacing in
order to minimize the backlobe. I somewhere saw 0.8-1 wavelength.

See you on 70
Chris.

  I am looking for the format of WEFAX signals. If you have the format,

or know of a reference, and can forward this information to me I would
greatly appreciate it.

  I need the information for a program to decode these and other signals
to higher resolution graphics cards (1024 x 768 x 32).

      Thanks! David Cook

What you are hearing is "commercial packet" It is in MMP protocol. Even
if you could capture the bits with your TNC you would spend the next
three lifetimes decoding the packet. Security is top on the list when
it comes to public safety. MMP is a proprietary Mobile Data International
protocol.

Crude rule of thumb is to stack them one boomlength.
You might want to start there and then play with changing
it while watching the pattern. Unless you have a fairly
clean "range" you may want to be content with that though
since you may have difficulty observing the effect of changes.

>but I don't believe the ones currently in use will often recover that fast.

Alan,

This is not a problem. Amateur packet radio frames begin and end with
HDLC "flag" characters, which do not appear anywhere inside the frames
themselves. Whenever a flag appears, the decoder immediately terminates
the current frame and begins looking for a new one. (The new frame
starts with the first non-flag character received after one or more flag
characters).

So as long as the stronger signal fully captures the receiver, it will
be decoded even if a weaker packet was already in progress. You will, of
course, lose the weaker signal's packet entirely.

Phil

Anyone have any experience with packet at 6m? Will skip and tropo
be a problem?

Seems like a digital radio at 50MHz would be *real* cheap to build...
Doug (Internet is pretty neat)

Out here on the left coast there is a state-wide backbone at 4800 bps using K9NG modems on 51.12. The radios are typically Motorola MOCOM-70s or MICORs, which often show up at swap meets for $100 or so. 50 to 100 watts is the typical power level. Unfortunately the skirts of the receiver's IF filters are a bit too narrow for 9600 bps.

It's not really a user access channel, but is instead intended as trunking between metro nets. The typical configuration is a pair of (ecch) Net/Rom nodes back to back: one on the 6m trunk and the other on 145.0x for user access.

Occasionally the 6m node will learn about distant nodes via skip but those routes soon fade away and get expired out of the routing tables. It seems a good idea to me to run the route expiration cycle a bit faster than the net/rom default of 1 hour on such a node. Also, because it's not a user access channel, you can turn off the net/rom autojam beacon.

According to the ARRL Handbook (which may or may not be the best source of this info), optimum spacing between long yagis is one wavelength- this would be the position for maximum gain. Closer spacing results in less net stacking gain, but a cleaner pattern.

According to the 22nd edition of the Radio Handbook by Bill Orr, W6SAI (which may or may not be the best source of this info- where did I just hear that? :^)), "...as a simple rule of thumb in stacking extended Yagi antennas, or other arrays having high gain, it is suggested that stacking distance be equal to 3/4 of the length of the antenna."

The numbers I have personally seen for stacking 432 antennas, seem mostly to run in the 60 inch range, for antennas such as the Cushcraft 424B which has about a 17 foot boom. This suggests a compromise between the previously mentioned references, and it may be that the gain degradation by spacing closer may not be as much of a loss as the pattern degradation by spacing them wider.

Bottom line, I'd start with about 60 inch spacing, I bet you'll be close to optimum. If your station setup allows, you can play with the spacing while measuring Sun noise when the Sun is just clear of your horizon. If you can't do that, just space them 60 inches apart and leave it- it'll be real close.

Hope this helps some.

about HF packet modems, why is it that no one has mentioned the subject
of using matched filters? I find this interesting because the British
Government has been using an MFSK system with matched filters in the
demodulator for about 20 years to communicate with its Embassies via
HF. Granted that they are NOT passing binary data -- although they
encrypt what they transmit, and one can consider that binary data! --
the system does work, it is very robust, and when you look at the
environmental requirements that precipitated their decision to use
this particular scheme the constraints look very much like those that
we amateurs have to put up with. For those that are interested, this
system is refered to as "Piccolo" by the various monitoring agencies,
and you can find limited discussions of it in swl manuals, and if you
know where to look, in some of the technical journals.

I'm not saying that we should use this system, but the general idea
might be worth considering. By the way, the baud rate for the transmitted
signal (not the input bit rate) is about that of a 10 - 12 wpm cw signal;
while the input signal bit rate is either 50, 75, or 110 bps. Any way,
some food for thought.

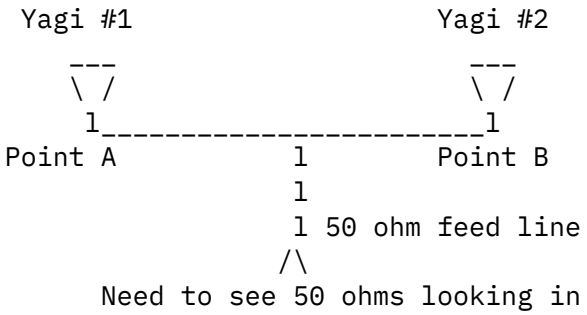
The ideal spacing is one wavelength to maximize the gain. This is
70 cm = 27.5 inches. I believe that one could also stack at multiples
of one wavelength to achieve the same characteristics, but I would
have to go through some calculations/computer simulations to be
certain this is true.

Another important consideration is feeding the array. Both Yagi-Uda
arrays need to be fed in-phase, plus you must maintain proper
impedance matching at the feedpoint, as follows:



The phase at point A = phase at point B. As far as how to do this, I believe both the ARRL antenna book and the ARRL Handbook both show methods for providing this feed mechanism (I know I've seen it in older editions). If you can't find it, email me a message (via UUCP given below) and I'll send you the details.

73's.

    Yep, the some guys up in New England (NEDA :: New England Digital Association) are using 1200 baud (last time I was there) 6m links for some long haul backbones. Plus with one site having over a dozen ports, desense becomes a problem, and you go for any band you can get!

    I've thought about 6m packet radios too. Contstruction at 50mhz is a little easier than at UHF...

MFSK systems like Piccolo are robust, but it's hard to get enthusiastic
about them because they are also very 1) slow, 2) bandwidth-inefficient.
F'rinstance, take a typical Piccolo configuration (Mark 3, I think), which
runs at 10 baud (100 ms symbol length) and uses 32 tone frequencies with
10 Hz spacing. This gives you only 50 bps throughput in a bandwidth of
320 Hz, or 0.156 bits/Hz. These aren't the kind of numbers which will
excite folks interested in improving HF packet throughput and spectrum
management! One area where the MFSK approach might fly though, is on the
EME path.

The next generation of HF packet modems won't likely be all that much
different from the MFSK modems - they too will use a set of orthogonally-
spaced tone frequencies. The main differences are that *all* of the tones
will be transmitted at once, and that they will probably carry PSK rather
than FSK modulation. Of course, since they'll be implemented in DSP boxes,
a separate robust MFSK mode for use on really nasty channels could easily
be included as a fallback mode.

Using a scheme similar to what Telebit does to get 19.2Kbps over a dial-up telephone connection?????

Given that packet uses modem signalling derived from telephone applications, it would seem appropriate to 'upgrade' the packet modem standards to match what the landline types do. Would the FCC object to PEP or V.32 operation to get higher BPS rates given that these encoding schemes do not take up any more bandwidth than a voice channel? Anybody working on it?

>The ideal spacing is one wavelength to maximize the gain.

This is not true. The maximum_forward_gain_spacing is a function of the
gain of the antennas being stacked. It could also be (almost
equivalently) considered to be a function of the boomlength of the
antennas being stacked.

There are also other considerations. Do you want maximum forward gain?

Do you want maximum front-to-back ratio? Do you want maximum
front-to-side ratio? Do you want some combination of these merit
figures, like almost maximum gain with a clean pattern?

     I hate to burst your bubble, but I know of a fellow radio hacker
who has been successfully copying mobile data terminal traffic in this
and several other so called "secure" proprietary protocols. He uses
modified commercial trunking capable radios with their built in FSK
demods to receive the bits and a combination of a stand alone micro and
an IBM PC clone to interpret the messages contained therin.

     He says most of the bits are used for various forward error
correction and parity schemes. Encryption seems mostly to mean using
proprietary alphabets (substitution cipher), overlaying the message with
a LFSR sequence (scrambling, such as used on many modems), and XORing

the underlying message or sometimes the encoded data after adding the FEC bits with a fixed multibyte pattern that is changed from time to time. (For example he says IBM field service transmissions to their portable terminals seem to use a 4 byte sequence changed every day and different for each terminal)

I do not believe that aside from Motorola's line of DES based DVP products (which really do use DES in a quite strong mode) most two way radio security is very secure. I personally think it pretty inexcusable for the manufacturers of these devices not to use DES or some moral equivalent - merely deciding that the protocol is complicated and nobody out there is bright enough to figure it out is pretty stupid in my opinion....

Of course the fellow who broke these mobile data systems was trained by the military as a cryptanalyst twenty years ago, so perhaps that isn't completely fair. But there are people who do this sort of protocol software work for a living who wouldn't find it hard either.

>X-Mailer: Mush 6.5.6 (PC R6.3 22-Sep-89)

In response to my earlier query about using packet on 6 meters someone suggested the possibility of TVI.

Is this likely? My metro area is virtually 100% cabled, if that has any relevance.

My kids 49MHz walkie-talkies don't cause my TV any problems - even if
I jam them right up its beak.

Bill,

In my opinion, this would be repeating a mistake. There's a fundamental
tradeoff between bandwidth and signal-to-noise ratio in any communications
system, and radio and telephone channels are usually quite different in this
respect. Telephone modems use modulation methods that are optimized for
narrow bandwidth channels with relatively high signal-to-noise ratios, and
this makes them inherently inefficient on many radio channels. They are
also usually designed for full-duplex operation, while most radio channels

are half-duplex.

The current Bell 202 "standard" came about only because modems for it were already obsolete (and therefore widely available at low prices) when the Canadians started experimenting with packet radio ten years ago. There's really very little that can be said in its favor except that everybody already has it. It's shamefully wasteful of both bandwidth and power.

It makes sense in many radio applications to spend bandwidth for power, and this is true for analog as well as digital systems. (FM is an example of an analog bandwidth-for-power tradeoff scheme.) On HF there is another consideration as well, namely multipath.

The moral is that you can't pick up a technology (like telephone modems) and expect them to work well in another, entirely different environment (like amateur packet radio channels).

Phil

One thing that seems to cause this is running out of RAM.. Do not run BM in a SHELL of NET, for instance.. Now, you say "how much RAM does BM require"? I don't know.. It seems like that depends on how BIG your mail file itself is.. Suffice it to say that I have lost my share of mail via BM.. This has usually been MY fault.. I now use a Desqview script to invoke Bmailer.. The script copies the entire PAT.txt file to "txt.pat"

before attempting to run BM.. Then my mail is safe and sound should I need a copy of it.. The locals used to give BM about 225K in Desqview. That seemed alright for a while, but if I left my mailfile unpurged, it got big and seemed to loose it's headers.. The moral of this story is:

Be wasteful of your memory, give BM a wide swath.. And/or consider trying VIEW, by Mark Bramwell. VIEW is a mailer which allows you to use Buerg's FAMOUS "LIST.COM" to read your mail.. SLICK! look for view on : HAMSTER.business.uwo.ca 129.100.22.100 in \view.. (use type I) and GET allfiles.arc.. I still use BM for certain things (Sorry Mark), but VIEW also has a permanent spot on MY hard-disk!

A few more VIEW features:

- it has a SIGNATURE file, so you can get PACKET RADIO people MAD at you for having wasteful "cute" signatures on the ends of you messages.. REally, don't use this feature to waste 1200B AMPR bandwidth!!!

-Let's you REPLY with >'d text.. So and So writes: >blah blah blah (MH7 :-)...

- has an uidigestify command for DIGESTS.

- can call other programs like LIST, QEDIT AND, has an add-on manager..

Hey, I'd better stop, Mark's head is probably getting big :-)..

There really is two ways of dealing with this. I would like to investigate
the success of a Telebit or a Microcom AX9624 on HF. According to the regs
I must maintain 3khz bandwith. The Communications Canada folks out here
seem to encourage experimentation. I would like to try it out on 10 or 20
meters and if that works lets set up some real high speed long distance
links. One of the downsides is that the TB works like a spread spectrum
audio channel, I don't know whats going to happen with fading etc...
This is one of the ideas. The Ham club I work with invented commercial
packet (I work at MDI) and they have tons of expirience with all kinds of
RF/PACKET problems. They just laugh at me and say HF PACKET is like working
with DC compared to what they are playing with now. Now all I have to
do is convince the "brass pounders" to have a serious look at Wide Area
networking on HF. I have been working with VE6BBM on a new and improved
protocol that would allow the use of standard tools. I will keep this
group posted as to whats new here.

problem with DES is that including it in a device makes it difficult
to export it. i don't know much about the market for these devices,
and whether or not each country makes them to their own spec, but i
would imagine there is some common component, and putting DES (or a
similar encryption scheme) into the picture complicates the sales
picture enormously.

i would also wonder what the people who use the 'encoded'
transmissions know about the encoding; it is entirely possible that
their intent is to simply not transmit plaintext.

finally, DES has been broken a variety of times by a variety of
people; not all of these people have been highly-skilled scientists,
either 8-]

                                       ^^^^^^^^^^^^^^^^^^^^^^

I'm looking into it.

Phil Karns has addressed the issue of why these modem standards are
inapropriate for radio channels, and I will further point out that
attempting to hook up a telephone modem via radio might work for FM, but

for SSB almost certainly not, because of the difficulty in eliminating the frequency offsets. Economically solving the problem of LO offsets in a bunch of independent radio tranceivers would go a long way in raising the bits/Hz figure in packet radio.   Any ideas? The cheapest thing that comes to mind is locking the LO to WWV or some other local broadcast carrier.

PEP is actually a nice modulation technique and I believe that eventually all (non-spread-spectrum) rf modems will use some variation of it. It produces an output signal with a Gaussian distribution, and this is the most efficient way of sending bits/watt. If you know the destination of your packet, you can measure the channel characteristics and shape your ouput spectrum to avoid dumping power into a spectral null caused by multipath. PEP shapes the spectrum by variable rate QAM in each spectral bin, which brings up the question of variable rate coding for specific station-to-station channels.

Shannon's theorems show that bit rate is proportional to SNR (dB), and if station A is just round the corner from station B with an SNR of, say, 90 dB, it is possible to push 56 Kbits/sec through a 4 Khz passband (using 16384-QAM !). Getting 14 bits/Hz is *possible*, not easy. This looks barely achievable with 16 bit A-D & D-A hardware and DSP chips, but complicates the networking a bit since station C, trying to monitor, may only get 30 or 40 db of SNR and has no hope in hell of decoding the entire packet. This implies that the channel coding scheme has to encode the network control (or broadcast) information with enough SNR so that every station in the local cell can decode it.

Now I admit, 90 dB is an extreme example of a high SNR, but many channel links will be better than your typical lowest-common-denominator 20 to 30 dB link. Doesn't it make sense to use radio/modem hardware that can take advantage of the SNR when it is available? I have resisted buying existing modem hardware on this principle, since what I want is a DSP modem that is backwards compatible with old modulation standards just by using different software.   I am hoping that 1990 is the year when such a product really appears at a reasonable price (Are you listening down there at TAPR & DRSI ?). Once such hardware becomes universally available, the Nightmare of the Nineties will be trying to get everyone to run the same version of the software.

The earlier mobile radio teleprinters did not use ASCII transmissions;
they were instead sending the dot patterns to be printed on the paper,
a "scan line" at a time. This was done because a "hit" in the received
signal would only omit a few dots which the human eye/brain could
easily reconstruct, but you'd lose whole bunches of characters if you'd
been sending ASCII or some other character code.

With the advent of higher computing power for cheap, FEC methods have
probably superseded this early technique, but it may be in use in many
older systems.

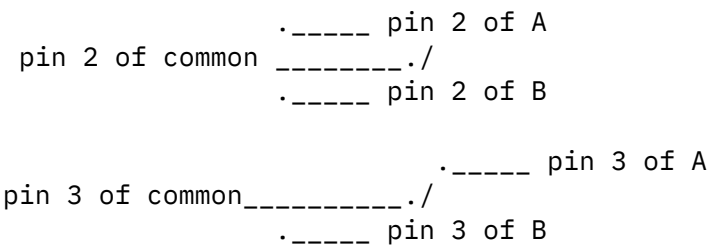
If you need to switch your computer between two RS232 devices (like a
modem and a TNC (amateur radio "radio modem"), and don't want to spend
a lot of money on those switches you see in Inmac, Misco, etc catalogs,
do this: (I'm assuming that you are using XON/XOFF mode, where only
pins 2 and 3 are active). Get a DPDT toggle switch. I used a small
switch, and mounted it inside the DB25 hood of one of the RS232
connectors in one installation. That avoided the problem of mounting

the switch inside a seperate loose box. Wiring the switch is simple enough, wire the wire to be the common to the center posts of the switch, and the A's and B's go to the outer posts. You just need to be a little careful that you don't get one line switching to A and the other switching to B, or some such. (It doesn't take a rocket scientist to get this right! :-)). Now for the grounds: Just tie all the pin 1's together, and tie all the pin 7's together. these are the grounds, and you don't need to or really want to switch these. I, in one place, tried using one of those Inmac switch boxes that switch all 25 lines. And I kept getting glitches when I threw this switch. I fixed that by strapping pin 1's together and pin 7's together inside the box. (make a note on the back of the box if you do this, so you will know later when you use the box for something else later on!).



tie pin 1 of common to pin 1 of A and pin 1 of B
tie pin 7 of common to pin 7 of A and pin 7 of B

(yea, this is trivial, but I've seen people spend a lot of money on those big switch boxes where the above is cheap and easy)

Is it true that the DOS version of BM really takes up that much
memory? The Mac version recommends 128K; I've actually been
running it happily at 96K

Pat--how big is a mail file you call "big"? Maybe if I stored 100
or more messages, I'd need more memory. Seems unlikely it would
balloon up to 255K, though.

Patty

>people; not all of these people have been highly-skilled scientists,
>either 8-]

Please back up this statement. There have been no known, proven cases in
which DES has been "broken" in the sense that the key was derived from
ciphertext alone (or even some matching cipertext/plaintext pairs) except
for cases where the key was trivially chosen (e.g., an English word), making
a brute-force key search feasible.

Attacks on systems such as Videocipher II have all relied on compromising
the physical security of the system in order to obtain the DES keys, or on

attacking the control system to enable the system to use its keys in ways counter to the manufacturer's intent. This does not involve "breaking" DES. This simply illustrates the fact that it is usually much easier to compromise DES-based encryption systems by means other than direct mathematical attack on the algorithm itself.

A back-of-the-envelope calculation *does* make the construction of a machine for the brute-force known-plaintext cracking of DES appear feasible, given plenty of money and the ability to design and produce large arrays of custom VLSI chips. I would not rule out the possibility that the NSA has already constructed such a machine, but it seems unlikely that any organization with lesser resources has done so.

In any event, after a decade and a half of intense scrutiny, the basic concepts underlying the DES algorithm still appear to be sound. Its main potential vulnerability lies in the choice of a marginal key size. This can be corrected by designing a new algorithm that incorporates the same principles as DES but with larger S-boxes and a longer key.

I'm not sure this is necessarily true. You can always gain in the power department (i.e., require less watts for a given number of user bits/sec) by adding forward error correction. The "coding gain" of such schemes is usually expressed as some number of dB with respect to standard binary PSK. This inherently relies on the tradeoff between bandwidth and power; to save power, you have to spend additional bandwidth.

>Now I admit, 90 dB is an extreme example of a high SNR, but many channel
>links will be better than your typical lowest-common-denominator 20 to 30 dB
>link. Doesn't it make sense to use radio/modem hardware that can take
>advantage of the SNR when it is available?

It depends on the situation. In spatial frequency reuse situations (i.e., most terrestrial links and many satellite links) the need to maintain a 90 dB SNR ratio (or signal-to-interference ratio, to be more precise) would require you to put transmitters so far apart that the total carrying capacity of the spectrum would be greatly reduced. It would be much better to use a different modulation scheme that doesn't require as high a SNR. Even though it means you don't get as many bits/sec/hz per transmitter, the ability to put transmitters so much closer to each other more than compensates for this.

Cellular radio illustrates this very well. The main reason cell phones use FM instead of SSB, even though SSB is ten times narrower, is because FM's much greater tolerance of interference (its "capture effect") allows the cells to be placed much closer together, increasing the total system capacity.

Congratulations to our very own netperson Bob McGwier, N4HY, on being named this year's winner of the Dayton Amateur Radio Association's Technical Achievement award. In part, the award recognizes Bob's inexhaustible work on the Microsat project.

This makes two years in a row that a Usenet denizen has won one of
the three Dayton awards. Anyone care to try for Ham of the Year
in 1991? :-)

And now for something completely different...

Recently, one of the users of my PBBS commented to me that he seemed to get
much better response when connected to the BBS via a NET/ROM node, if he
used the node simply as a digi rather than connecting to it first, and
then downlinking to the BBS. I expressed surprise that this would be so,
but upon further reflection concluded that there was a plausible
explanation for this behavior. Consider user A connecting to BBS B via
node C, where A and B cannot hear each other. Assume that there are no
other stations active on the channel. If C is used as a digi, everything
proceeds normally, with no retries necessary. What if C is used as a
node? B transmits one or more frames, receives an ACK from C, then C
transmits the frames to A. Here's where the problem arises: B typically
will have more frames queued to transmit, and it will jump on the channel
when C finishes, colliding with the ACK from A to C. Both B and C then go
into recovery... hopefully, the FRACK values et al are such that C will
recover first and get the frames down to A successfully before B barges in
again. Because of the number of variables (timing parameters, possibly
different channel access protocols, different behavior of AX.25 versions,
effect of other users on the channel, etc), it's hard to analyze what
happens at this point. Maybe single retries from C to A and from B to C
will do the trick, maybe not... but then we're just set up for the
collision scenario to repeat itself again. Very messy business, this.

The new PRIACK channel access protocol would apparently solve this
problem, by causing B to defer transmitting until A has had a chance to
send its ACK to C. Trouble is, PRIACK is only available in TNC-2
firmware, and the vast majority of PBBS and other packet applications do

not use this firmware for their AX.25 support. Until this protocol is incorporated into other AX.25 implementations, I'm forced to conclude that for links involving a single half-duplex packet repeater, it's much better to use it as a digipeater than as a store-and-forward node. Can anyone see flaws in this (admittedly simpleminded) analysis? Any dissenting opinions?

A related question: in the older channel access technique involving the use of a fixed DWAIT interval (still in common use), digipeated frames are given priority on the channel by automatically having DWAIT set to 0. In the various implementations which use p-persistence (e.g., NET/ROM, TAPR 1.1.7, and applications like KA9Q NET and BPQNODE which use KISS), is there still some preferential treatment given to digipeated frames? The answer is almost certainly NO in the case of NET and BPQ (w/KISS), since the digipeat function is not handled by the firmware which handles the channel access. I'm not so sure about the others, though.

One last question, and I'm outta here: is anyone looking at adding PRIACK to KISS?

I don't use double-dos or desqview. BM was only program I had loaded in memory, I wasn't shelling out of net to run it. Using a sub shell wouldn't work well, any traffic on the freq while in a subshell isn't handled. The tnc's buffers would overflow and data would be lost. I always exited net and ran
BM, then restarted net. Having to exit net to read or compose mail is a major pain
if you receive any real amount of mail. I have tried to keep my machine on as much as possible so that other stations can make use of it. Having to take it down
all the time to deal with mail makes this impossible.

Now I just use NOS. I telnet to my own system and send mail with the (S)end command. No, it doesn't have all the nice features, but I don't have to shutdown
the network to do it. Shutting down the network is totally unacceptible. Having
to wait a couple of hours to read my mail while a friend's FTP completes at 1200
baud doesn't thrill me. I'll take the simple mailer in NOS over that anyday.

NOS the only way to fly, except for a total lack of documentation, its a great program. I know read the source, I have and my eyes are killing me after this weekend.

Howdy:

I am working on DSP based modems for HF. This work is being done on a Motorola DSP56001 hooked to a HD64180(protocol engine). This modem uses multiple carrier QPSK, and for now at least, I use a pilot tone, N dB down from the other carriers, where N is still being played with. The idea, is to

have few Hz wide first order PLL's track the data channels and a wider second order PLL track the pilot tone and supply the freq offset to the narrow PLL's. I am using 4 carriers at 75 baud, I will see if I can get 8 carriers at 37.5 baud. The idea is to beat most multipath, get 600 bps and occupy less than 800 Hz. So far, it meets these criteria in THEORY. I am instituting tests with N6VV, W3IWI, and VE3GYQ as soon as the production units come off the line. With 2 Khz spacing already on HF, this 700-ish Hz of used spectrum should not cause any heartaches. I have not done a thing about the crest factor problem and sideband radios other than divide the power on each carrier to the point where this will not occur. This will probably be unacceptable in the final version, even though I believe their will be no way to set this in reality as guys will have their `mike gains' set from rear end to appetite and anything I do to beat it, will be overcome by operator intervention ;-). We'll see what the trials give us in the way of feedback on this. The reason for choosing these stations is that they are currently on the air with super active HF stations and have lots of traffic to pass and are technically competent to hook this stuff up `in parallel' with the existing gear (all are running PK-232's) and give a comparison. Because of the <<LLLLOOONNNGGG>>> symbol times compared to the required sampling rate (aliasing, Nyquist and all that), I will be using IIR filters in the Costas loops for the data since FIR's just require too many taps to get the narrow bandwidths and these sampling rates (probably 7000-ish). This test set up will allow seamless operation, as the DSP box runs AEA interface code, and the modems can be changing from 300 bps, 200 Hz shift, FSK to mac-modem with a simple command (probably set up in their forwarding files)

modem ##

where ## is the number of the modem in the directory of modems stored in ROM. The modems currently residing in ROM in addition to these are

(1) Bel-202.
(2) HF packet (subset of BEL-103).
(3) All RTTY modes, including AMTOR.
(4) Morse.
(5) Satellite modems, all currently operating birds, including a quick hack that seems to work for Oscar 14 (9600 bps K9NG/G3RUH compatible) with the discriminator output from my IC-471H. I will add adaptive equalization to this (remember satellite signals are around `forever' and slow adaption, even if blind, buys you a lot). Demod ONLY for AO-13.
(6) WEFAX (APT and HF), the recent article in QST inspired me to emulate this in software.
(7) BPSK.
(8) KPC-2400 style QPSK (this one actually seems to work ;-)

To be finished, hopefully before Dayton:

SSTV
HF modem just described

I would like to work on 4800 bps duobinary and modified duobinary (HAPN compatible without the tradeoffs is duobinary). I like modified duobinary as a possibility for plug and play with most existing radios (FM) since it has no DC component and has a zero in its spectrum at the bit rate. This means this can fit into an existing FM radio if the phase group delay is not just unbelievably awful (should be more successful than the 9600 bps schemes used now). This appears to be a more sane approach to using existing radios at a sacrifice in speed over the 9600 but plug and play. If I cannot make it `plug and play' I see no advantage over the G3RUH 9600 modem. The goal is put it in the mike jack and speaker jack and go 4800 bps without impossibly long lock up times such as in using PSK. Modified duobinary is controlled intersymbol interference and 0 excess bandwidth IN THEORY.

After the HF modem work, I hope that VE3JF, W3IWI, and a few others will begin thinking about a new synchronous protocol, adapted for HF and its vagaries. I intend to make the modem adaptive eventually but for now I would like to shoot for a single workable HF modem at practical bit rates.

I apologize if this was too dry for most. Just wanted to keep several of the readers here informed and I don't have time to write all of them individually. I find all this exciting and for all my years of doing DSP, I still get exciting going

Upload MODEM

to my new toy.

If you have any bright ideas you would like for me to consider, please let me know. WARNING WARNING: Unless explicitly prohibited, these ideas could be used in a commercial product with the above hardware and I don't have the time and patience for intellectual property games. If you don't want me using it, don't bring it up.

Bob

P.S. Regardless of the harsh words, and the current topic at their next meeting, this HF modem can and should run on the AMRAD board shown in the latest QEX as well as those I am working on. Actually they probably need a bad guy to inspire them to finish something for a change ;-).

>Patty

It's been some time since we (Madison, WI. HAMS) have hashed this out..
The thing is, as you play with things and tweak the memory available to BM
downward, eventually, you loose all your mail in the process. Yes, I could
do more testing and maybe get it down to 150K or somthing, but I have a
workable/nontechnical solution. I just throw RAM at it *and* also back up
the mailfile automatically.
  "BIG" mailfiles for me are maybe 300k by-the-way.. (I still run LIST.COM
  against my BIG/long mail files manually.. It's a hard method to beat.)

As to my suggestion that DOS people try VIEW from HAMSTER, I suppose I
should warn folks that it probably isn't any less likely to loose mail
when out of RAM either...
 I should ask Mark Bramwell about that. On that note, I should
say that Mark has been busy over the weekend with enhancements to the VIEW
mailer.. Interested parties should GET ALLFILES.ARC and MAILBOOK.EXE
from Hamster.business.uwo.ca 129.100.22.100 . The price is right!
Do I sound like I'm from "Secular Humanists for no BM"? :-).. I like VIEW

because I like LIST.COM from Vernon D. Buerg.. Nuf said.

Pat%kd9uu.ampr.org@pgd.adp.wisc.edu 128.104.198.22

P.S., I still run BM (frequently) myself.. It's a lot better than any mailer
 I could write!

Subj: DOVE RECOVERED

Howdy:

W5UN and/or NK6K reset the DOVE CPU and got the transmitter off last night.
Dave Blaschke, W5UN, is the owner of the world's largest privately owned
2 meter antenna. With 32.5 dBi gain, and nearly 2 megawatts of EIRP, he
has been transmitting the reset sequence for several days. The batteries
began flattening out and we were alerted by Alberto Zagni, I2KBD, that the
transmitter power was dropping significantly at the end of the eclipse.
Alerted to this fact, I had a planning session with W5UN as to the two
best times to reset the spacecraft CPU and turn the transmitter off. The
first was at the end of the eclipse period, when transmitter power would
be at its lowest point. If it turned out that the battery voltage was too
low to maintain the GASFET preamp in the receiver, then the next time to
try was just as the transmitter power was falling off (soon after it left
the sun and started the voltage descent in eclipse). The latter was the
time which turned out to be successful. Almost immediately following the
reset, NK6K sent charging rate commands and transmitter state commands.
This morning, I sent the S band transmitter on command. It immediately
came on and K0RZ relayed acked packets, etc. to me over the phone (I
don't have S band capability YET). Bill claims that the S band signal
varies from about 20-30 dB out of the noise. IMPORTANT!!: If you have
S band capability and copy a series of short packets, this will contain
vital telemetry, please preserve it for us. YOU MUST CAPTURE RAW FRAMES,

and this is usually done by using KISS and some binary capture routine.
TLMDC.EXE, the microsat telemetry can capture, but not decode these frames.
This has been a harrowing experience (for many) and once again, these
robust little cubes take a lickin and keep on tickin!

28844	B $	1630	AMSAT	@WW	DB2OS	02-Apr	RUDAK-2: Launch delayed!

de DB2OS @ DK0MAV

The launch of RUDAK-2 and RADIO-M1 (RS-14), which was planned
for 12 April 1990, is delayed until July 1990 due to a problem
in the scientific GEOS satellite. All analog and digital
transponders of the new RS bird are tested and ready for
launch.

The Downlink frequency of RUDAK-2 is 145.983 MHz with
nominal output power of 2 Watts HF PEP (max. 12 Watts).
Uplinks are on 435.016 MHz for 1200 Bit/s Manchester FSK
(FUJI, PACSAT) modulation, 435.155 MHz for 2400 Bit/s BPSK,
435.193 MHz for 4800/9600 Bit/s RSM modulation and 435.041 MHz
for Digital Signal Processing (DSP) experiments.

Please do NOT use these Uplink-Frequencies until RUDAK-2 is
fully commissioned by the RUDAK commandstations.

Detailed informations about the RUDAK-2 system were published
in the latest AMSAT-DL Journal. The english translated
version will be soon published too in the OSCAR-NEWS of
AMSAT-UK, AMSAT-NA News Service and other sources.

Please forgive me for being very naive on this subject, but it's something
that I've been interested in (while perusing rec.ham-radio.*) and I would
like to learn a little more about it.

I've recently compiled KA9Q (TCP/IP) package for UNIX on my 3B1/UNIX PC.
I've gotten it configured so I can run SLIP between my two 3B1's over
a serial connection. Why you may ask would I want to do this with
my STARLAN connection, the answer that I just wanted to learn, and with
two local machines, it's easiest. I'm still having problems getting
the "telnet" to work properly, I think it has to do with how I start
the "telunix" and the gettys on the pty's (if someone might have a clue,
I'd appreciate any pointers).

Well onto my questions, please E-MAIL me I will *summarize* this ...

How does one get into HAM-RADIO and interfacing it with computers so I
could conceivably connect up to the .AMPR.ORG domain and have a TCP/IP
connection for TELNET's and FTP's?

What hardware does one need?

The cost involved?

How do I go about getting an FCC license (what's involved education wise)?

Does one transmit modem tones (eg. Telebit Trailblazer PEP tones) over

a particular frequency? How do you interface the modem to the ham-radio equipment?

What range in miles does the transmitting and receiving get done? How big is the .AMPR.ORG network? And what computer hardware/ham-radio hardware do they generally use?

Thanks in advance for any insight.

-Lenny

I am considering purchasing a mult-mode controller for my shack. All I see available in the market is the KAM, the PK232 and the MFJ1278. My problem is I do not know what each of these does over the other, and their pros and cons (I am still new to this stuff they call packet...)

I would appreciate it if folks out there could let me know their views, experiences and recommendations that will aid me in gathering information before purchase. Also I would like to know if there are any articles comparing the three units. I do know ecah unit has it's own set of unique bells and whistles. But, I do not know which unit will serve my needs, fit my budget and give me the best value.

Please e-mail to FGHOUSE@UWLAX.BITNET.

Thanks
Feroz N9FJL

Subject: TR7930/7950 PACKET MODIFICATION

CIRCUIT MODIFICATION FOR KENWOOD TR7930/7950 TRANSCEIVER
FOR PACKET/RTTY OPERATION
BY: WA4IXN

THIS MODIFICATION PROVIDES CONTROLABLE AUDIO OUTPUT TO PIN 5 OF THE MIC CONNECTOR FOR SINGLE PLUG PACKET/ RTTY OPERATION.

REMOVE TOP COVER OF TRANSCEIVER AND CAREFULLY DISCONNECT SPEAKER LEAD PLUG FROM "RX UNIT" BOARD. LOCATE PLUGS"J-13" ON THE RIGHT FRONT OF THE "RX UNIT" BOARD AND "J-18" ON THE LEFT REAR SIDE OF THE BOARD. NOTICE WHICH WIRE GOES TO PIN "8-M" ON "J-13" AND TO PIN #5 ON THE MIC CONNECTOR. REMOVE PLUG "J-13" FROM THE BOARD AND LOCATE THE SPRING TAB ON THE SIDE OF THE PLUG THAT HOLDS THE "8-M" CONNECTOR IN PLACE. USING A SMALL AWL OR POINTED TOOL, PRESS THE TAB DOWN AND CAREFULLY PULL THE "8-M" CONNECTOR FROM THE PLUG. WORK THE WIRE FROM THE HARNESS SO IT WILL REACH BACK ALONG THE LEFT SIDE OF THE BOARD TO PLUG "J-18". USING THE AWL OR SMALL POINTED TOOL, CAREFULLY SPREAD THE "8-M" CONNECTOR A SLIGHT AMOUNT SO IT CAN BE FITTED LIKE A SLEEVE OVER ANOTHER CONNECTOR OF THE SAME SIZE. LOCATE TERMINAL "AP" ON PLUG "J-18". INSERT THE SPREAD TERMINAL "8-M" INTO THE TOP OF PLUG "J-18" SO IT FITS AROUND THE TOP OF TERMINAL "AP".THIS IS A FAIRLY TIGHT FIT, SO USE CARE NOT TO BEND THE TERMINALS BY USING TOO MUCH PRESSURE. ABOUT HALF OF TERMINAL "8-M" WILL STICK UP ABOVE THE TOP OF TERMINAL "AP". THE LOWER PART WILL BE FIRMLY SLEEVED AROUND TERMINAL "AP" INSIDE THE PLUG. DRESS THE WIRE AROUND THE LEFT SIDE OF THE BOARD. REPLACE SPEAKER PLUG AND INSTALL TOP COVER. PLUG TNC CABLE WITH PTT/AUDIO IN/AUDIO OUT/GROUND CONNECTONS INTO MIC CONNECTOR AND IT'S READY TO GO ON PACKET/RTTY. NO SOLDERING IS REQUIRED AND UNIT CAN BE RETURNED TO ORIGINAL STATE AT ANY TIME IF NECESSARY.

Note: I haven't tried this, proceed at your own risk! WA2ISE

I have a radio that I use almost exclusively for packet, a Motorola HT220
handie-talkie circuit board + a power amp. Was wondering what simple mods to
the audio section I should design (i.e. maybe more high freq response?)

In article <37@thoreau.nsc.com>, greg@thoreau.nsc.com (Greg Dean) writes...
>ISDN (Integrated Services Digital Network), is a new network protocol
>which aims to handle both voice and data (including X.25). Hardware
>(and probably software) are or will be available to facilitate an
>ISDN. It seems to me that ISDN running over a few microwave links
>would solve both of our linked repeater and packet problems. This is
>something the Amateur community should be on the leading edge of.

ISDN isn't a protocol. It's a set of services and interfaces. ISDN is
what the phone company supplies, implemented using digital (rather than
analog) signaling. Most of its components are taken from existing
telephony; some are new -- mainly the call setup protocol and the
physical link (wireline drivers). It has nothing to do with microwave
links or anything else like that; it's what you'll get soon when you
call and ask for a phone.

How can hams use it? The same way we use any other telephone wormhole.
But then it's not "ham radio" per se. On the other hand, ISDN means
that the non-ham BBS/modem crowd will soon have 64 kbps dial-up (the
ISDN circuit rate). And they don't even know morse! ;-) Somehow ham
radio won't look state of the art anymore. (Hey, it _was_, years ago.)

In article <23214@usc.edu>, kjh@pollux.usc.edu (Kenneth J. Hendrickson) writes...

>ISDN is much too litle and far too late (IMHO). I want a few 10Mb/sec
>lines coming into my house.

See below about "Broadband ISDN".

>Recently I saw Dr. Robert W. Lucky here at USC. Dr. Lucky writes the
>Reflections column in IEEE Spectrum. In his talk, Dr. Lucky mentioned
>quite a few interesting things:

>1. More than 98% of your telephone bill reflects the cost of
>   sending you the bill and keeping track of the accounts.
>   Almost none of your bill goes to maintaining the equipment; the
>   telephone companies are in the _service_ industry.

Either you misquote him or he's full of bat guano. How do you think
they pay to maintain the equipment -- government handouts? Prices and
true cost are out of line (less so than a decade ago) but telephone
companies have lots of real costs, particularly capital (recovered as
depreciation) and labor (guys pulling wires).

>2. Over the past few years, the bandwidth capability of the
>   technology has risen at a phenominal rate, while demand for
>   bandwidth has remained constant.

Partially true; demand has risen, especially on the data side. But not
as fast as supply. This has of course reduced profit margins...

>Some of Dr. Lucky's suggestions were:

>1. Give people HI-FI voice lines.

ISDN allows the 7 kHz ADPCM to be used over its 64 kbps circuits; that's
better than the usual 3.1 kHz. B-ISDN allows true hi-fi; CD-quality
was demoed in France some years ago.

>2. Give people wide bandwidth data lines.

>(Note that the cost for both of the above is near zero! See above.)

B-ISDN will allow high bandwidth (as in 150 Mbps). It ain't cheap,
though; they have to pull glass to your door. That might not cost a lot

more than copper, but the _installed_ cost of copper averages something
like $1k/house, capitalized.

>3. Allow the phone companies to provide cable-tv type
>   entertainment. (Dr. Lucky suggested that what he wanted was 40
>   or 50 'channels' all playing the same movie continuously, but
>   starting about 5 minutes apart. You could start when you
>   wanted, go to the kitchen or bathroom and then switch 'channels'
>   to pick up where you left off. This would be quite
>   convenient.)

B-ISDN allows dial-up of a video channel (around 135 Mbps). Not that
the CATV crowd is happy about that, but that's show biz!

>ISDN is a good idea, but it is very old technology. We should have had
>this years ago. Let's take the idea of ISDN, (which is basically a good
>idea), and update it to reflect current technology. I want a few
>10Mb/sec lines coming into my house.

Narrowband ISDN is mainly old technology, ordinary digital telephony and
X.25 with some new glue. Broadband ISDN is newer technology, using
all-glass transmission (well, mostly glass) and interface rates in the
150 and 600 Mbps range. It's got a lot of other "novel" features, and
requires some more development before it'll be practical, but you can
expect early deployments within a few years.

N-ISDN is better than analog telephony. Let's appreciate it for that.
Even 64 kbps beats a modem!

If you're using a TNC that has an XR2211 FSK demodulator chip in it (as nearly all TNC-1 and TNC-2 clones do), you can GREATLY improve the receive performance of your packet setup by adding in the "XR2211 DCD mod kit" available from TAPR for around $11.00. You can then steal the receive audio from the top of the volume control and you should be decoding signals that were formerly uncopiable.

See the article "Can We Continue to Ignore Level One" by Eric Gustafson N7CL, in the 6th(?) ARRL Networking Conference Proceedings.
- Brian

P.S. When you have a moment, you might want to register your site in the UUCP routing maps so that replies can reach you, eh?

Hi everyone -

I am curious about how well IP address clustering is working in the packet world ... I am working on a paper that addresses some related issues (to be released when I feel it is ready), but either way one looks at it, a good, effecient IP packet system depends so very much on a good clustering system, and this seems to be like it could be rather tricky to set up. For instance, what happens for those sites who are along borders of IP subnets? When you have built a backbone, say, western New York through to New England, how does a packet entering the network know which way to go, and how does it know where to get off?

I have read all of the technical information, and the
papers from the Computer Networking conference proceedings, on
routing issues, but am interested in some practical results from
those areas of the country which already support IP.

Since IP is a flat addressing space (at least at the network level) there
is not all that much experience in clustering. The IS-IS routing protocol
in ISO has two level clustering, and mechanisms for dealing with cluster
partitions. Certainly the NSFnet backbone represents a kind of clustering
in the Internet world, although the IP addresses don't reflet the
clustering arrangement. In that case, a mixture of protocols are used
to provide the routing information that tells where to get on and where
to get off the backbone. In the backbone itself, a scaled down version
of IS-IS is used. In the networks hanging off the backbone, different
things are used. In many cases, a default route to the backbone for
all unknown destinations is used. In others, more complete routing
information is provided.

Also, have you read the Landmark Routing literature? This is work of
mine that does clustering in such a way as to facilitate self-
configuring networks. A published paper is in SIGCOMM 87, and I
have several other reports as well. I have been thinking of trying
to adapt this work to packet radio, but haven't moved on that as of
yet.

Yes, this was done for a while. Various newsgroups were distributed
using the CNN satellite feed. (I think they were sent as data on one
of the 'vertical retrace' scan lines in the NTSC signal). I remember
being able to see the data in the retrace interval while it was going
on. I don't know what ever became of this.

...as are most of your postings!

[flame on]

Rec.ham-radio.packet is meant to DISCUSS packet radio, not REPLACE it!
I'm sure other system administrators are not thrilled by your continual
waste of bandwidth -- I'm not.

And since you seem enchanted with modifications, why not take the time
to: (1) at least edit the pbbs prompts off the article, (2) TEST the mod
so that you don't pass along bad information (in addition to quantity!),
then (3) see if you can find someplace more APPROPRIATE, like perhaps
the MODS DATABASE?!

[flame off]

My suggestion is use what you have. Most TNC's have been designed to work
with almost any audio circuit. Some suggestions might be to remove low
order components since the detected audio is 1000 Hz shifted around a
center frequency of 1700 Hz, (1200 and 2200 Hz). The best reception will
be realized if you purchase one of those "state machine" mods from TAPR.
This circuit will remove the noise component from the signal and will
allow you to run an open squelch which will give you quicker signal
acquisition.

This advice only holds true for 1200 baud packet and does not take into
account distortion of the received audio.

Clean up your receiver and transmitter and reap the benefits.

>X-Mailer: Mush 6.5.6 (PC R6.3 22-Sep-89)

A group of us are building a 9600 baud system to augment the 1200 baud
existing system in our area. We are currently planning to use 440MHz
to avoid interference with other packet activity at 2m and 220 MHz.
We want this channel to work well so we have committed to *requiring*
fast-switching radios for operation on this channel; in other words,
no-one is going to wait around for your T/R relay to throw...

Do any of you have advice of any kind for us? We particularly need
information on the types of commercial hardware that is available.
We are also capable of building if there are kits or schematics
around.   Are there any engineers from the TAPR PacketRadio project
on this list who would tell us what might be involved in a conversion
of that unit to UHF?

Thanks to all who can help... ...and, what the heck, to everyone else,
too. 73 Doug and the Highspeed Group of VARPA.

I would very much appreciate anyone, who could send me some kind of a satellite tracking program for the Macintosh. It doesn't have to include graphics, as long as it works. Naturally, I'm looking for PD software. The ability to understand Keps in NASA bulletin format would also be very nice. Please send the file(s) with email in Binhex format to:
s36572u@puukko.hut.fi
Any microsat telemetry decoders for the Mac would also be appreciated.

The TNC-II appears to take a Z80 SIO-0 or /0. There are other SIO's in that family, like the SIO-1 or /2, I believe. As I recall, some of the other SIO's have certain pins bonded internally, or have slightly different characteristics. The question: can I put a Z80B SIO-2 in a TNC-II and have it work o.k., or must it be a "-0"?? I am trying to get the TNC ready for higher speed use with a WA4DSY modem. That should tide me over till the K3MC AWSOME I/O card hits the market-place.

Close. By Dayton. For Sure (echo...). As posted to another group, we've recently
had our motivation to get done by Dayton increased.

Price. Reasonable.

>functions and availability available?

V40 uProcessor, 7.9 MHz
Two 85C30 SCCs
One channel FD DMAed
two chanels HD DMAed
last channel INT driven only

768K DRAM/256K EPROM (looks like we'll be able to handle
64K EEPROM too).

DS1286 Watchdog/calender/clock

PC bus access via shared memory window, 8K or 64K, user programmable,
with starting address user programmable.

The design criteria is to support one FD T1 speed link, two roughly

LOCALtalk spped lines and one more line in the 19.2Kbps range.

We hope it will run stand-alone as well.

Full Programming spec available by the end of the month.

N6RCE

To: ALL
I have a low opinion of CW as a communications mode. There is, however,
one argument I can't answer. In poor channel conditions, with lots of
interference, two good CW operators can communicate when all other modes
fail.

Perhaps there is an argument for producing a truly bomb-proof digital
mode. Don't go for speed. Any speed faster than a good CW operator
is adequate. Another trade off would be reliability rather than
the most efficient combination of bandwidth and data rate. CW, after
all, is pretty grim in this respect.

On the software level, I wonder if a combination of forward error
correction and packetization might help. I suspect, however, the key to
the problem is the means of encoding the data on RF. The FSK systems
need very accurate tuning and frequency stability, a serious drawback
for a bomb-proof system.

Maybe, if the amateur community can develop such a mode at the right
price, we can then bury CW for ever.

Hey, try looking at what the Voyager spacecraft have done. That beats
CW by a mile. Or look at military systems, like spread spectrum, etc.

The Galileo spacecraft has been switched into a mode of sending its
telemetry at 10 baud. This is because the spacecraft is very close
to to the Sun (angle-wise, as seen from Earth that is). QRM sources
don't come much bigger, (or more powerful).

Possibly a drawback for an idiot proof system, but very accurate frequency
standards are readily available, and not inordinately expensive. I bought
a McKay-Dymek shortwave receiver in 1977 that claimed something like 10Hz

per HOUR drift, less if you specified selected components. It was $1500 at
the time, you can get them for $400 or so at Hamfests nowadays, maybe less.
Note that this receiver also had SSB, AM, etc. capability, so you could easily
design one for half the cost for a specific purpose...

>

>
Good idea. Then let's get more people using non-neandrathal networking
protocols, like TCP/IP. Or better yet, some of the 'Reliable' data
protocols being worked on for military command-and-control systems, which
use forward error correction, built into IP like packets. Let's get everyone
to upgrade from 1200 baud, huh? for starters. There are a lot of people working
their A**es off out there just to get stuff like 9600 baud, 56K, etc. working.
They could use some help...

The only strong argument for retaining CW these days is to restrain the
hordes from taking over our spectrum. A sufficiently difficult technical
test could do that too. And from what I've heard on 20 lately, some of
the yabos are making it in anyway...

Our Earth Science Department purchased a Kenwood R-2000 HF receiver and an
AldenElectronics 9321 Weather Chart Recorder for reception of radio fax weather
pictures. Being the resident ham on the staff of the college they
assumed that I would know how to hook the gear up. Unfortunately I have not
had much experience with HF yet. I have set up a long wire antenna and can
hear some sort of data trasmission on the freqs. that came with the Alden docs.
Nonetheless we have never seen anything printed in the fax machine except
black lines.

The questions:

     -- Is there a better way to receive weather pictures with different
        gear? Is there a TNC and PC setup that might work better than
        the paper based fax unit?

     -- What should the receiver bet set on? (AM, USB, LSB, CW)

     -- Is a long wire good enough or do we need a beam or something?

Any assistance or help would be greatly appreciated. Earth Science won't

let me walk down their hall until I get this thing working.

I am having trouble getting information about the w2xo bbs software
for Net (tcp-ip) under unix. The standard distribution does not in-
clude the config.xo file. There is no mention on how to set it up
either. If you have information or know where I can get it I would
appreciate it..

Thanks, Bill

>could be rather tricky to set up.

IP doesn't depend at all on clustering. IP is a flat address space. Use of clustering is purely an "efficiency hack", though it has proven to be a very useful one.

Most amateur radio TCP/IP routing is done by assigning addresses so that they cluster within areas of RF connectivity (*not* geography), and setting up static routing hints for reaching nearby clusters. This has worked fairly well until the recent snowballing of interest in IP on packet...

However, it has generated another one of those nasty user confusions that take bloody near forever to erase... that it is somehow "right" and "ordained" that routing should be designed around and based on the notion that addresses are clustered. That is just *wrong*. Any reasonable routing implmentation would be wise to group routing information that is received such that it can take advantage of natural clustering to minimize the size of the route table, etc., but again... that's "just an efficiency hack", and should not be a fundamental assumption.

>For instance, what happens for
>those sites who are along borders of IP subnets? When you have
>built a backbone, say, western New York through to New England,
>how does a packet entering the network know which way to go, and how
>does it know where to get off?

Currently, manual intervention to generate static routing hints.

There is such a system. it's called "Peace". Let the nuclear survivalists build their own hardened bunkers and worse case scenarios, the REAL world needs REAL

data communications for REAL problems like hurricanes, tornadoes, earthquakes,
and such.

Is there somebody out there who can tell me where , and how, to get the latest
version of the KA9Q package ? Mind, that I'm talking about sources !

I have also some questions:
     - Is this the right newsgroup ? I hardly see any messages concering
       KA9Q.
     - What is KISS ?
     - What is NETROM ?
     I have the feeling that I shouldn't include such code if I can't link
     up to such devices (??)
     - What is Nos ?

I concur but less politely. I think its unlikely that the CW ops do the yelling about requiring a code test on the exam. CW ops know its obselete, they run CW because its fun.

I am opposed to a code test (sorry Lyndon) but the only mode I enjoy is CW - it requires skill, all the other modes require only money. I am interested in packet but once the hardware is functional and the bugs are worked out of the protocols etc - which I hope takes a long time - it will be as boring as a 2M repeater.

That is real b - o - r - i - n - g.

Two things needed here - one on topic, one not!

I'm interested in getting going with packet, but have no idea what I might
need. I own an AT compatible PC, and an old tube-type SWAN HF transceiver.
Can anyone recommend any good reading material or other paths to follow to
help me figure out what else I need to get or do in order to get a packet
station on air?

Although this may be the wrong forum to request this, I'll try it anyway.
Is there an info-list available via BITNET that covers the rest of the ham
radio spectrum?

Thanx for your help...

>

There is no question that the assignment of addresses to allow grouping
of a set of nodes (i.e., clustering) is a necessary WHEN THE AMOUNT
OF ROUTING INFORMATION EXCEEDS CAPACITY TO CARRY/STORE IT ALL.
There is also no question that clustering adds algorithmic
complexity to the routing algorithm because of things like
partitions, address filtering, and so on.

If one needs to cluster, and if there is natural clustering
(i.e., RF connectivity) then the address clustering should follow
the natural clustering. I think it is especialy useful to do
clustering when a network is formed around one or more backbones.
I don't know if the packet radio net is this way or not.

The above comment seems to me to be saying "design the network as
flat, and cluster when appropriate and easy", and is railing against
the opposite attitude, which says "design the network as clustered".
The problem of designing for flat is that it can be real hard to
cluster later on. For instance, the Internet right now is up against
a real scaling wall because of their flat address space. If they
had designed for clustering from the start, for instance by
expressing all addresses in the routing algorithms as address/mask
pairs, evolution towards hierarchy would be much easier. Perhaps
the best attitude is "design for flat operation but easy evolution
towards clustering".

Andre
  I've been running ka9q on an Atari ST for about two years now.
Rob PE1CHL has done a great deal of work porting various versions
of the code and adding some very nice features.
  Sources are available here in the US (as well as object) but
you would probably do better contacting Rob.

>TAPR office and ask.

The 1278 uses a 2211, but it will not benefit from the TAPR DCD mod. The
1278 already has the improved DCD circuitry built-in... to my knowledge, it's
the only currently available TNC which does so. The DCD mods were published
by N7CL at least a year and a half ago. The fact that so few TNC vendors
have not seen fit to upgrade their products in that time is, in my opinion,
a disgrace. Pardon the digression, but I had to get that off my chest. :-)

I have compiled the xobbs software and it seems to work locally by typing
xobbs <call> but when someone attempts to connect to the bbs via ax25 I get
on my screen either: axincoming: Permission denied or prinout: Permission denied
Does anyone have any ideas as to what is casing this? I also get the following

when I sign on local: Mail forwarder not running   mail saved but not added to list.

Any ideas as to how to correct this also. The 'F' command says for Sysops only Well since I run the system I dont know how to make me a sysop?

thanks in advance.... bill@mousetrap.canton.mi.us or n8hqg@wa8ooh.mi.us.na

Louis A Mamakos WA3YMHI released an Amiga version of Phil Karn's KA9Q
Internet Protocol Package. It has been refered to as AMIGANOS890930
and is Amiga B1.1 version of 890830 NOS. I don't know where it resides
but if you'll send email, I try to find out.

I have been thinking along similar lines. If I remember correctly, packets were sent in bit column order. By this I mean that all the bit 0s for the packet were sent, followed by all the bit 1s, and so on. If you had an 8 bit byte and a 4 bit FEC, then all the bit 11s would be sent last.

The theory was that noise is not random. It is bursty. So, once noise disturbs one bit of a packet, it is more likely to hit the following bit. With this scheme, if you get a single burst during a packet, and that burst is less than the bit time times the number of bytes in the packet, then the error is correctable. This is because it hit, for example, all the bit 5s for a number of characters, leaving the remainder of the characters intact and able to correct the hit.

It seems like the poor characteristics of HF packet could be improved with some techniques like this. The FEC could be sent to improve the reliability of the channel and leave the rest of the protocol (ACKs, etc) intact. Of course this would amount to the use of a non standard alphabet, so I guess that for HF this will have to remain hopeful musing. Maybe it would be useful for high speed UHF packet?

Perhaps I'm missing something, but this seems like a text-book answer
to my question that just *can't* work in the real world. Isn't the
entire "Local Area Network" a form of clustering? If the addresses
weren't "clustered" (maybe the problem is that I'm just using the
wrong word), then connecting to 129.21.201.2 (my machine) would be
a confusing thing to do: the first few bits wouldn't select Nysernet,
and the next few bits wouldn't specify WHERE in Nysernet, and the
next few bits wouldn't specify which LAN within RIT, etc.

Maybe part of the confusion is that on packet, we don't have any
have dedicated IP routers (yet!). When they come, and when we have
a "backbone" net spanning the globe, the LAN concept will become
crucial. (I personally feel that it already is crucial - but it's
much harder to change the current system than it is to shape the
future one). Then, in a well-defined system, the first 24 (more or
less) bits could point out which LAN you're on...if you have a
properly chosen address, then the entire network ALREADY knows how
to route to you! The only work comes in giving them information to
translate your hostname into an address, and in modifying tables
each time a new LAN is brought into the network. How can this
work without heirarchal clustering of addresses?

Please tell me if I'm all wet here (no offense will be taken - aren't
we all still learning, after all? :-))

My understanding is that these are licensed copies of the G3RUH design, which
is sort of a derivative of the K9NG design. As such, data on the use of G3RUH
modems should apply.

Not that I have any to share...

I just got PE1CHL NET and it is excellent. One notable feature
is the digipeater, which looks exactly like a digi but works
just like a node.

It does this by simply directly acknowledging packets addressed
to it as a digipeater by synthesizing packets that look like
they are acks from the destination station. Likewise the
reverse direction.

This is so simple and nifty - why doesn't everyone do it this way?

Sorry if this is stale news for anyone, but I thought it was
great...

73 Doug.

All this talk about TCP/IP has me wondering, what about the ISO/OSI
(Open Systems Interconnect) that is supposed to be an international
standard? I have heard for the past few years that TCP/IP is aging
and going to be "out", and ISO "in". I'm new to the packet scene
but am sort of suprised at TCP/IP being "new" to anyone. Any
news on ISO for packet? Has ISO died/been deferred/have nothing to do
with packet? I'm not necessarily a fan of ISO, it's just that
enquiring minds...

>Using the heath-supplied proms, I'm behind the times. I'd like to be running
>protocol version 2 (L2V2).

TAPR has actually generated a hardware upgrade for the TNC-1 and clones, such
as the HD4040, that adds the digital part of a TNC-2 to the TNC-1. It allows
you to run any TNC-2 firmware, which some folks seem to think is neat. Call
TAPR and ask about the TNC-1 upgrade kit.

I just run KISS in mine, with the KA9Q package...

>been selected, but is the HK-21 the smallest TNC available??? Does it
>have any built in problems??? Should we give up and go back to CW? (never!)

The HK-21 is the smallest TNC I know about. The only problem I have with it
is that it uses an energy-detection carrier detect circuit, instead of the
more current true *data* carrier detect as pushed by N7CL/TAPR. This means
that you really have to run with the radio's squelch turned on, which can be
a problem with a radio that unsquelches slowly.

Works fine with my Kenwood 2600 and Toshiba laptop though, and allowed me to
have some fun with the New England IP network while visiting inlaws in RI over
New Years...

Don,

This is one of my "hot buttons". Suffice it to say that ISO/OSI is wonderful for those who like to *talk* about networking, while TCP/IP is generally preferred by those who *do* networking.

This state of affairs is not likely to change for some time.

Folks,

I want to say this in the kindest, gentlest way I can, but I have to say once again that the usage policy of at least this campus network do not permit messages that (a) are against the law, (b) violate the NSF/IAB ethics statement, (c) solicit or offer employment and (d) conduct private business for profit. We have interpreted this policy as forbidding for-sale messages of any kind. I do not harbor any ill feelings toward Mr. Weis, who

for all I know may be unaware of the sensitivity in this area; however, as one who is called from time to time to justify what seems to many others a frivolous and nontrivial expense to support networking in this state, as well as defend the faith against perceived attackes by virus, worm and plain crooks, I feel compelled to run a squeaky-clean shop. This includes the machinery and students I support, the student groups I advise and campus committees on which I serve.

I value my association with the packet-radio group and have supported it since its inception. I can understand others have differing opinions on the utility and ethics of the contributions, both public and private. If our network was supported other than with public funds, I would have a quite different position. However, since we are supported from state and federal funds for teaching and research only and are not for profit, I feel compelled to defend the above policy.

Accordingly, I am requesting that my name be severed from this list, as with any other list that violates the policy above. I am directing my students and advisees, including the members of our radio club, of this policy and advising them that their computer accounts, etc., may be forfeit if any list to which they subscribe repeatedly violates the policy.

>bit error rate is a property of layer 1, the physical layer.

Whether using baseband or RF, you'll get layer 1 errors with any scheme.
When we didn't have computers to perform error correction, we had humans
to do it. So how come no one ever thought-up a good computerized error
correction method for IMC?

>   But the character code itself is also
>inefficient, as we will see...

You're right. But English is even less efficient as a language than Morse
is as a text code. So, should we all start speaking Esperanto?

There is a problem you have not dealt with. It's MIGRATION. You need to
get people using the new technology without ramming it down their throats
and/or causing implementation headaches. For me, debugging software is
often the fun part, but that's not true for the average guy on the air.
Then too, todays hardware and software is tomorrows surplus bargain.
Some are skeptical of buy (or "buying into") something they'll just have
to junk in five years. Remember, the C64 used to be a hot computer.

Considering the era when he first developed "the code", SSB Morse was a
glow-in-the-dark bright kid.

I have given my Zenith ZWL 183-93 laptop a static Zap and blowen the
mother board. This has essentially eliminated my portable packet station.

If anyone has a cheep source of these boards.. Please let me know.
So far I am at $350. ugh....

copied from packet:
 Msg# TSP Size Read To   @ BBS From   Date Time
 3059 BN 1750   2 ALL   WB3CPF 900125 1943
  Subject: WILSON HT'S AND PACKET

     If your interested in putting your old Wilson HT to use in the
     packet mode and do not have the schematics, here is some
     information that you may need.
        The spkr/mic connector has 6 pins and 5 locking tabs (which
        guide the connector into it's socket on the HT). The tabs
        are pattered such that there is one large tab by itself and
        the other four smaller ones in two groups of two. The pin
        next to the large tab is #1 and #2-6 follow clockwise.

             Function   Pin #   Spkr/mic* wire

             Mic   1   red
             Speaker   2   white
             PTT   3   blue
             Ground   4   black (shield)

             *Note that the spkr/mic I'm referring to is the
             Wilson and that pin #6 is empty and #5 is wired but
             not used in the spkr/mic nor necessary for packet.

I am successfully using the Wilson 1405SM (5Watts) on packet
with a TXDelay of 230 msec (so far). I added an open circuit
female jack to the battery pack for charging and external power
supply. To avoid cutting the connector off of the spkr/mic for
the TNC connection, I put 2 closed circuit jacks (a mini and a
sub-mini) on the spkr/mic casing so that I could keep it as a
spkr/mic and receive plugs from the TNC. The closed circuit type
jacks disconnect the spkr and the mic when the TNC is plugged
in.
Any further info or response is welcome at

Because there are methods that are both far more efficient and far easier to
implement on computers. Remember that Morse is a digital code designed for
direct reception by humans; the design considerations for a machine-
readable code are quite different.

>You're right. But English is even less efficient as a language than Morse
>is as a text code. So, should we all start speaking Esperanto?

I should probably defer to a linguist on this point, but your assertion is
probably wrong. Every time I've seen one of those multi-lingual warning
stickers on a piece of equipment (e.g., the one inside a PC that tells you

not to open the power supply) the English version always seems to occupy the least space. Among other things, English has shed most of the baggage of grammatical gender that plagues most other Indo-European languages.

But even if I accepted your premise (that English is "inefficient") I would not accept your conclusion. Machines exist to serve people, not the other way around. Communication systems that use computers should allow people to use their natural languages whenever possible. Any coding that needs to be done for efficiency's sake should be done by the computer, not the human. Hand-sent Morse Code is about the least "user friendly" form of electronic communication there is, a point that has figured prominently in several ads by Apple Computer and others. (I'm referring specifically to one of their early two-page Macintosh ads. One page showed a hand key, and was written entirely in Morse. The other side showed a mouse, and in standard Latin characters the text began "Why aren't you reading the other side of this page?")

>There is a problem you have not dealt with. It's MIGRATION. You need to
>get people using the new technology without ramming it down their throats
>and/or causing implementation headaches.

You misunderstand me. I'm not trying to ram any new technology down anyone's throat. You can use CW from now until doomsday if you wish. If there's anyone ramming anything down anyone's throat, it's the "CW-forever" crowd that rams Morse Code down the throat of anyone who wants a ham ticket, even if that person would prefer to further the service in a different way (like developing new digital communications techniques). To the extent that the "CW-forever" crowd argues its case through provably false assertions (e.g., by claiming that CW is somehow the most efficient communications technique known) I am compelled to refute them, one by one, as many times and as often as necessary.

Phil

Sorry you feel that way Dave. I am 27, have been a ham for 15 years, have a
degree in computer science, program/develope hardware for a living, am into
packet, slow/fast scan TV, etc, and still to this day use CW as one of my
primary modes of communication. Dave, tell one other mode of communication
that can be decoded in as narrow bandwidth as 100 khz (or less), under extremely
noisy conditions, (man made or other), and can be used in the middle of the
night when the kids are asleep in the room right above you (HI).
All in all Dave, in the rare situation when all other modes of transmission are
basically ruled out due to noise, over crowded conditions, or other, good old
CW (Morse Code) tends to get through. I hate to admit it too Dave, but I still
believe there is a place in the Amateur's inventory of skills for this ancient
mode of communication, good old Morse Code.
>
ETC...

Greetings.
I am a university student here at The University of New Brunswick
and I am presently researching a presentation I will be making
on the use of Packet Radio in emergency communications.
I will be highlighting its use in the SanFransico Quake and I am
in need of statistics, debriefings, and actual messages that were
passed during the quake. I already have sent requests to key hams
in the areas that were affected but have recieved little response.
I would sincerly appreciate any help that anyone caan offer me.
This presentation is for the Atlantic Engineering Competition to
be held here in the Atlantic provinces.
You may contact me via E-Mail: F8F7@UNB.CA
or via packet. VE1DE @ VE1WL
I already have several calls that people have forwarded to me but I
am in need of some concrete text.
Many thanks...Jerry F8F7@UNB.CA

>CW (Morse Code) tends to get through...

As Phil Karn has pointed out, digital modulation techniques have vast advantages over Morse when it comes to punching signals through noise and congestion. If you want an example, consider the Telebit Trailblazer modem, which can push 14kbits/s of clean error-corrected data through a few kilohertz of bandwidth on a good phone line, and 5-6kb/s through lines to South America and India that are almost unusable for anything else. 14kb/s, with something like Lempel-Ziv compression, is two typewritten pages of text per second, or about 35000 wpm. Take the 5-6kb/s rate for a very noisy channel, cut it by 10 for a few hundred Hz bandwidth, and it's still 1250 wpm. That's absolutely clean data, zero errors. Admittedly, this is a high-tech example with some serious digital signal processing hardware involved... but you can buy the phone-line version over the counter for about $1000, and cutting the bandwidth by that factor of ten should cut the processing requirements the same way.

When even Morse is ruled out by noise and congestion, good new digital is still going strong.

Karn, refuting my claims about Morse, writes...

>International Morse Code is a terniary code. It has three elements: dot,
>dash and space. You can, of course, represent it (or any information, for
>that matter) in a binary code, but at the expense of additional bits.

I submit that any code represented by two electrical states is a binary code. (I'm going through a hardware phase right now.) Morse characters are variable length bit strings with letters frequency coded for the English language.

>This is a flawed analysis, as you almost admit. If you want to compare
>apples to apples you should not compare Morse with ASCII. Compare Morse with
>Baudot, a 5-bit code. Neither has the lower case letters that you consider
>unnecessary for transferring English text, despite the fact that most of
>your posting was in lower case. With a more level playing field, Morse
>rapidly loses ground.

I confess to deliberately omitting Baudot. Counting the start and stop bits, Baudot characters are about 8 bits. Analysis of long text samples yield an average of about 8 dots/character for Morse, making it a toss up. I use lower case letters for aesthetic reasons; THEY ARE NOT NECESSARY TO PRESERVE THE MEANING OF THE MESSAGE. But, they are harder on the eyes, for some unknown (to me) psychological reason. I chose ASCII because most packets are coded thus, albeit without the start and stop bits of async format. AX.25 doesn't pack ASCII characters on 7 bit boundaries, does it? If not, then its still a toss-up between the three systems if you neglect the packet overhead.

>And if you discount the "dumb terminal" mode of operation, i.e., if you
>allow your computer to do more than emulate a 50-year-old Model 15, you can
>do even better with modern computer-based coding methods. For example, file
>compression programs for PCs and Macs are now extremely widespread, and they
>routinely yield bit savings of 60% or more on typical ASCII-encoded English
>text. These algorithms adapt automatically to the characteristics of the
>input text in ways that no human operator, using Q-codes and abbreviations,
>ever could.

I very carefully specified "English text" several times in my posting for this exact reason. After being passed through a data compression routine its not text anymore. It is still an open question whether such binary data is allowed on HF, the allowed alphabets being specified by the FCC. I admit that this is an idiotic regulatory relic but there it is anyway.

>Once again let's level the playing field. Those overhead factors should also
>be added to your CW message; it should begin with something like KA9Q KA9Q
>KA9Q DE N7AHL N7AHL N7AHL R R R FB PHIL -- before continuing with the "quick
>fox" message. The overhead in an AX.25 packet provides the functions of this
>header and more -- there being no CRC in most CW-encoded messages that I've
>copied.

The packet overhead is required for every packet. For CW, its only required once every 10 minutes. I never said the headers weren't useful or important; only that they reduce the usable bulk transfer rate. Deep

in the dusty old files of my mind I seem to remember error detection procedures for CW traffic handling; perhaps some brass pounder out there could enlighten us.

>I believe I have refuted this when a fair comparison is made and modern,
>readily available computer encoding techniques are used. The *only*
>advantage Morse code has EVER had is that it can be sent and received with
>very simple equipment. Modern technology has steadily reduced this advantage
>virtually to zero in most situations.

     I can't argue with any of this, except to say that modern encoding techniques are not used for packet around here. (Not that here constitutes a valid sample by any stretch of the imagination). Maybe we ought to start in on modulation systems now? Remember that I am most interested in HF ionospheric paths, not line of sight microwave. Such paths do nasty things to the phase of an RF signal...

There are a few systems available I know of.

K9NG developed a simple FSK modem which was reworked by g3ruh.
Because of the extreme low frequency that has to be xfered these units
are only useful on fullduplex channels (to avoid the long turn-around-
time)

A member of AMSAT-DL developed a RSM modem (square spectrum modulation)
I know of only one link in use. But these units require a precise
alignement and specialized TRXs.

The HAPN group (Ont) supplies a AMI modem, which was designed for
4800 , but should be usable at 9600 if the components are modified.
Expense is pretty low.

Since 1986 there are NORD><LINK's DPSK modems available. A dibit
encoding scheme (conforming to CCITT V.26) is used thus the
Baudrate is 4800 at 9600 bps. Some hundred units are spreaded worldwide.
The main advantage is it's fast turn-around-time of ~ 5msec at 9600 bps.
No alignement of the modem is neccessary.
This comes for the expense of a more complex circuitry.

ALL these unit require modifications of of-the-shelf-TRXs.

I heard that some people are doing EME (moonbounce) with something like 100W and using a digital modulation scheme that gets thru even when a regular rig only hears noise. Bit rate wasn't too fast, maybe one a second? But it did get thru. Maybe not real useful for distributing packet messages, but if you don't mind taking all night, on a freq that is otherwise empty (one of our microwave bands?)....

Did you know: That when you buy something "made in China", that something like half the money you pay goes to the Chinese government. The same government that did Tiananmen Square last June. Don't think I want to pay them anything after that. Don't worry about the workers there loosing their jobs, they get paid even if there's no work to do. Or so I've heard.

     I have been good and put the following files on ~/pub/nos at
flash.bellcore.com :

netpop.arc
nospop01.arc
pop.doc

     netpop.arc

is the source needed to compile with net source to
produce a version of net that runs pop.

     nospop01.arc is the source needed to compile with nos source to
produce a version of nos that runs pop.

     pop.doc is the doc for pop. This doc is also in the above arc
packages.

     The author of this package, Mike Stockett, WA7DYX would like
feedback. You can contact him via US mail, telephone, Packet BBS
etc plus anything sent to me for him will be forwarded.

     For those souls who do not have industrial strength networking
facilities, I can make the above package available on an MS-DOS
formatted disk. As a bonus I will throw in compiled NET.EXE
with the pop stuff built in - such a deal. To get the disk, you
need to do the following:

1 Disk (5 1/4 360K or 3 1/2 740K)
1 Mailer with your address on it
  Postage to cover
1 Note telling me you want the POP package

Send the above to:

Julian Macassey, N6ARE
742 1/2 North Hayworth Avenue
Hollywood
California 90046-7142

     I have never run the pop software, I have just read the docs.
But there seemed to be some interest in this, so I am making it
available.

My problem is being FORCED to learn Morse to get a ham ticket; if the requirement were for knowledge of modulation schemes, coding theory, communication protocols, or any other communication technology that has some relevance to the modern world I would do so cheerfully. I have absolutely no quarrel with those who WANT to use Morse; just don't force me to participate. Learning Morse in order to use radio for digital or voice communication is like being forced to learn how to saddle a horse in order to get a pilot's license.

Phil Karn has made telling arguments in favor of techniques more modern than Morse. To deal with de Mike's specific comments on Morse (It's better for low bandwidth, works in the presence of noise, and is quieter): I regularly communicate through bendwidths much narrower than 100 khz (most often via the 3 khz phone system), and am able to get data rates well over 9.6 kbps; I would no more think of using Morse than I would of using semaphore flags or smoke signals. There are numerous ways of dealing with noisy channels, all of them better than Morse. I regularly communicate at night in a room above one occupied by sleeping children; the uploads and downloads my computer does are absolutely silent and use transparent error-free techniques over noisy channels that require no special knowledge of nineteenth-century esoterica on my part.

The existence of this dispute suggests that there is a significant population of folks out there like me who would get licensed and, IMHO, contribute to the growth of amateur radio if they weren't forced to work at acquiring a skill so clearly out of the

technological main stream.

>... in the rare situation when all other modes of transmission are
>basically ruled out due to noise, over crowded conditions, or other, good old
>CW (Morse Code) tends to get through...

This is in fact the main advantage of CW. It really works when every
other way failes. It's reliability, not efficiency.

If you'd take a look on a weak CW signal on SW (prepare your eyes
with an oscilloscop) you'd see ...

nothing |

The signal is within the noise, but you could separate / demodulate
it by means of your human computer. You shouldn't underestimate the
capabilities of this neuro-computer (some people tend to call it
brain). Even S/N ratios of 0 (zero) dB are usable for CW data
xfer. We're far away from that with any other demodulation scheme |
But this only works for the expense of an enormous programming
procedure of the computer. Which means you have to train, train,....

Remember that sophisticated exercise of demodulation of AMPR signals
in STARTRECK n some months ago here in PRDIGEST ? Remember that
enormous expense to strip the noise from the signal? If you'd be
willing to install a SUN4 size workstation in your TNC you might
have a chance to regenerate those weak / hashed signals for data
xfer.

DSPs?

Shure, but these systems don't play magic either.

After all you'd might expect me to be a plain CW freak ?|

Well. I'm not.
I've passed the CW exams some 16 years ago, and never used it in my life.
I don't like CW |

But it's reliability is a fact. And this could be enhanced some more
if you'd change to CCW (coherent CW). There was a short burst of
CCW activity about 10 years ago here in central Europe. Don't know what
happend to it. Haven't heard about it any more. Anyone any idea?

So after all I'm going to develope some new hardware for noisy xfer
channels (FEC, adaptive equalizer, etc). But one daemon in my
neuro coumputer still checks the reliability of a new development
against CW....

Uh, this is getting really religious... Can we agree to hold this debate by direct mail, not via the 5E4 sites on the Internet? There are of course, valid points for everyone to make pro CW or anti CW. Further, almost every argument has been presented, among other places, in the pages of QST. This topic seems be generating at least 50% of the volume for packet-radio, etc., which could possibly be used to discuss things that we might learn something about...

This is all great, but where is this technology. I mean, yes I am familiar
with the Trailblazer modems, yes they are super technology, but why do I
see 300 baud packet, taking up nearly 3kc on 20 meters, resending packets
nearly 50% or more of the time (extremely more during crowded conditions)?
I believe thats at best 150 baud throughput (average, if that). In theory,
this technology sounds fine, but in reality we just aren't quite there
yet (on HF anyway). So, when all young hams can 'afford' this technology,
maybe then we can dump Morse code, but until then, I think we should leave
well enough alone.

Just my opinion, Mike...

Has anyone used the converse node software for TNC2? I have burned an
eprom and the node seems to run. Multiple people can connect and
start chatting, however, if someone does a /BYE strange things happen..
The node will try to send any outstanding packets over and over even
though the other station has gone through the official disconnect commands..I
allowed the node to retry for 15 minutes to see if it would time-out..It didn't..
The version of software is THENET mini converse node 1.0

Is there a newer version somewhere for FTP?

This is nonsense.

The reason your weak CW signal looks like "nothing" on a scope is because it hasn't been "match filtered" to remove the noise outside the spectrum actually used by the signal you want to demodulate. Run it through a narrow filter before putting it on the scope, and you'll see it just fine (if you can hear it, that is). Remember that "S/N ratio" depends critically on the bandwidth of the receive filter, and figures quoted without mention of the receiver bandwidth are meaningless. For example, a CW signal with a 0 dB S/N ratio in a bandwidth of 3 KHz becomes a S/N ratio of 10 dB after being run through a 300 Hz bandwidth filter. For another good demonstration of this phenomenon, borrow a spectrum analyzer and note how the level of the "noise floor" changes with the "resolution" setting.

Yes, the ear/brain can perform some matched filtering on CW signals. But it seems to be pretty well established that the effective minimum "bandwidth" of the ear/brain combination is no lower than about 50 Hz. However, digital signal processing techniques have no real lower limit on effective bandwidth. Several times before on this forum I've mentioned N4HY's accomplishment in demodulating the 4 bit/sec telemetry signals from the Soviet Vega balloon probe as it floated in the atmosphere of Venus. He got "solid copy" from his program despite the signal being so weak as to be COMPLETELY INAUDIBLE to the ear when the raw tapes were played back. The reason was that the effective bandwidth of the demod was an order of magnitude smaller than that achievable by the human ear/brain.

>But it's reliability is a fact. And this could be enhanced some more
>if you'd change to CCW (coherent CW). There was a short burst of

CCW is a very crude system. It does demonstrate some of the principles involved in coherent modulation. But you can do far better by using binary phase-shift-keying with more modern digital codes, as is presently used by three of the four Microsat satellites. Unlike CCW, BPSK is coherent in the recovery of carrier phase as well as bit timing. CCW's (and ordinary CW's) use of on-off keying precludes you from gaining the 3 dB improvement yielded by coherent carrier recovery (because there's no carrier reference during the OFF intervals). It also represents an inefficient use of the transmitter's peak power capability, since you have it turned off much of the time.

Phil

I have a TM-2530A that is driving me crazy. I want to use it on packet but have discovered that once the PTT line is hit, the transmitter will not drop off for almost a full second. I have looked the schematic over and even done some circuit tracing with a logic probe, etc. I even broke down

and gave Kenwood tech support a call. I will try them again, hoping that I will get a different person. They said that the delay was probably in the microprocessor ROM code and they didn't know how I was going to get around it.

For the moment I have increased the TXDELAY to make any packet last for the duration of a hold cycle. The throughput is going to be unacceptable since I want to place this radio on the hilltop as a node. I presently have clunker radios up there and was hoping to replace them with this model.

Does anyone have a work-around for this problem?

Post it or send mail directly! I'm about ready to auction 2 of them off if I can't speed up things.

Thanks for your interest.

I downloaded a few days of WEBERSAT picture data and wrote a quick program to extract out the data from the PHOTO packets. I am now trying to decipher the data. Does anyone know the format and how it's packed into the AX.25 frames? I'll post the postscript for the pictures as soon as I get something that looks like a picture.

if there'd be nonsense it would be the relating comment.

Because exactly this problem is described in the posting: separating
the noise from the signal and demodulate/decode it.

The problem becomes obvious to everyone if you'd take a look to
voice recognition systems. There's no wide spreaded system (means
a system which would be available in amateur's price range) that's

immune against all kinds of accents, all different kind of voices, if a
voice got hoarse, bandwidth limited voice transmitted by
a phone, frequency shifted (SSB), etc etc. No such system could
separate all these influences (noise) from the pure information
(I'm not talking about research project's prototypes).

But this is where the human computer really shines. It got all of these
sophisticated adaptive filtering mechanisms. Which makes it possible
to separate / demodulate the signal even if it's within the noise.

It's one thing to claim: all nonsense, I know how it COULD be done.
It's a different thing to realise a filtering system that could be
reproduced by amateurs.

I've tried it some years ago when I developed a C-QPSK modem for PR.
This utilizes a digital filtering mechanism to get rid of phase
distortion and other noise. And it comes close to the theoreticaly
optimum. But it's far away from a S/N of 0 dB. Same problem with
ALL other modems on the scene.

A similar filtering solution was made for those CCW systems. The
bandwidth was forced down to 10 or 20 Hz (different systems have
been in use) by means of digital principles to strip the noise.
But what to do if the TX chirps at 30 Hz and escapes at 200 Hz/hour?|
(don't treat this as a question).

Detlef

I'm thinking of converting an old Tempo/VHF One 2 meter rig to
a packet station. It has an accessory jack on the back, but I don't
have any docs on the thing. I've looked for ads from Tempo in all of
the ham magazines recently and can't find them. If any one has the pin-
out of the connector or an address for Tempo (if they're still around)
please send me mail.

Thanks,
Michael

 I have a TM-2570A which occasionally goes brain-dead as you describe.
 It seems to happen when there is an electrical storm - maybe something
 takes a hit in the internal program. The simple quick fix is to give
 it a microprocessor reset by turning it on while the PS key is pressed.
 Note you will lose your memories by doing this.

>business for profit. We have interpreted this policy as forbidding for-sale

But that is an illogical stance. There is a world of difference between
Joe Ham saying "I have a IC2AT for sale", and Icom advertising their newest
over usenet. Most ethics statements for not-for-profit businesses are
designed to play CYA with the IRS, to protect their not-for-profit status.
Private individual items offered for sale do NOT violate the IRS's rulings
or guidelines. I can appreciate your trying to play things "by the book",
but in this case, the book says it's OK. Check with your trustees, admini-
strators, and the IRS. They will tell you the same thing.

I use this exact scheme with my FT-209. However, i would like to warn FT-209 users of a really DUMB "feature" of the 209. The internal microphone on the FT-209 STAYS CONNECTED even when you plug something into the microphone jack! So, while you use this rig on packet, the mic is hot! This means that if there's noise in the room, say for example, you have the HT sitting on the table next to your computer's printer, you'll transmit that room noise over the air on top of your packets!

I agree, I'm probably one of those people. I know I'll never use it and I find it irritating that someone wants me to learn it for no good reason. And I am one of the types of people who tends to push and develop new technology and uses for it.

Well, I for one, would be firmly in both camps, as you describe them. I do most of my work on packet, but the fact that it's 'radio' and involves propagation modes, antenna construction, etc. is important. I use real database systems (like Compuserve) every day, but still log into my local PBBS system to pick up the packet/amsat news, etc. regularly. It is true that I spent the majority of my time doing stuff like writing software to decode satellite telemetry and other 'communicator' type things, but the excitement comes from the fact that it's a 'radio' type communication mechanism. There's something magical about throwing signals into the air directly to another amateur, with no intervening cable, PSTN, etc., that isn't changed whether those signals are Morse, SSB or Packet.

On the other hand, I love to have a free cellular phone, I'd just take it with me to field day... :-)

>Code. Quite whining and just do it!

    This is just too much. Mike, how is it that you have come to
    believe that you have any more rights than your fellow citizens?
    If you think about it, code/no-code is more an issue of the
    right of people to access a resource. It is NOT a matter of
    laziness or whining.

    I for one have come to the opinion that most of our spectrum
    should be given over to a public digital radio service, cellular,
    and perhaps some space reserved for the people who are really
    moving the state of the art forward (eg satellite, digital, networking,
    etc). The basic premise here at work is whether Amateur Radio
    serves the public good (on the average) more than just reassigning
    the spectrum to other services. Some cycles put forth by
    a few amateurs involved in Hugo, SF earthquake, etc do not pay the
    bills. Sorry. It is my opinion that one useful service to throw
    some spectrum at would be something like Usenet, as the knowledge
    base created by such networks can only work to our advantage as a
    society. We should foster networks such as Usenet by dumping the
    Amateur allocations between 50 mHz -> 3 gHz and building the media
    required to set up such networking. Licensing would be just a
    tech exam. No doctrines on content or use. No grandfathering of
    current hams. Amateur Radio used to serve the purpose of creating
    various knowledge bases, but lately it seems more a media of endless
    contests below 30 mHz, and endless bowling/gall bladder/"I'm driving
    to get cigarettes", etc discussion above 30 mHz. What is it that
    gives us the right to sit and bullshit on 2 meters for free, when
    one car over the guy with the cellular phone has to pay $0.50/minute
    to have the same discussion? We need peristroika (sp?) for the ARS
    and we need it badly.

Dear Friends,
  I am new to a Ham radio license (KA3VRV), however, not new to ham, commercial communications, etc.. I'm President of a small high tech computer design and development company involving computer hardware and/or software systems. This includes many specialty areas such as robotics, data communications, CAD/CAM, etc, etc, etc.....far from being a lazy person. Wouldn't you say?

  As far as code goes, this has been my inhibitor to getting a license up until now...but I finally got it. I almost had it 20 years ago, but the code didn't interest me then (nor did a code only license back then), and doesn't thrill me now either. I do understand the many good (an well justified) reasons to have the Morse code (minimal radio needed for transceive, gets through were others forms have more difficulty, etc.). I'd like to have a General license now, however, the code's going to hold me for a while.

  I think that what ought to be done now is that all ham's be forced to have a minimum code speed of say 5 WPM, a rounded radio theory/history background. Then from there create a list of achievements that have to be met to get to higher license classes. Something like trying to make a balanced meal for a day's eating, or getting a degree from college.

  This would allow the new Novice class license to have an overview of ALL forms of communications at a minimal level (code, AM, FM, SSB, pulse, RTTY, packet, etc.). From there the higher class tickets would require a "points" system, 30 points for a tech, 70 General...well you get the idea. The points could be generated by learning and testing for skills in

a wide variety of subjects related to amateur radio.

  Think of this, this allows every ham to become efficient at what they prefer to do to their best advantage (and the ham communities) AFTER MASTERING THE MINIMUM REQUIREMENTS FOR NOVICE CLASS.

  The new novice class would actually require a more rounded general radio background for testing to get to be a ham, from that point on there would be many specialties. This would also keep the "10-4 good buddies" out of ham radio, however, allow more "specialist" to join and enjoy ham radio (as well as benefit the entire ham community).

  Think about this for a minute. Wouldn't it be a boring world if all "extra class" careers were just lawyers or doctors? We wouldn't have any chemist, biologist, metallurgist, engineers.....or radio operators!

>well enough alone.

I'll only reply to this paragraph and I won't cross-post it.

I think the very nature of ham radio, especially on the code-conscious low bands, works against using decent technology for ham packet. First off, 300 baud packet isn't 3 kc [sic] wide; with the usual 170 Hz shift, the signal would fit nicely through a 500 Hz filter. The resending is a result of a) use of poor modulation techniques (simple FSK without optimizing such as MSK); b) QRM (nothing we can do about that...) and most importantly, c) poor protocols.

AX.25 was designed for low-noise environments. As an HDLC-family protocol, it has NO forward error correction capability. Clobber one bit and you clobber the message. Real commercial digital radios are generally better. They use FEC coding so some number of bit errors per frame can be corrected without retransmission.

But who in ham radio thinks about those things? When "accomplishment" is defined in terms of 20 WPM CW (i.e. the Extra) and you're scum if you don't do morse, we aren't exactly encouraging the research needed to fix things. Combined with the ARRL's virtiolic and short-sighted rejection of bandwidth regulation in favor of ancient mode regulation, we need special authority to use some of the better-understood data protocols, at least on HF. Golay, anyone?

       A ham ticket is like a drivers license. There are rules that
you gotta know and skills you gotta prove before the rest of us let
you out on the road. Rights? Sorry. If you don't prove you can drive
better than <some level> (hopefully better than most of those on the
freeway in Houston!) then I don't want you on the road. What about
MY rights?

        True, with cars it may be a matter of life or death, but
spectrum is a scarse resource which SOME of us would like to preserve.

        "Archaic" skills? Sure, like hand signals. Do you know them?

        Rick, the "no coders" have just about won. So why present
arguments that don't fly like "rights". The code/no-code debate IS
about laziness and whining ... to the the pro-code side. It's about
electric -vs- roll-down-your-window-and-stick-out-your-arm turn signals
to the no-code side. (the pro-code side says we should keep the old
method in the test, even tho many drivers will never use it) It has
nothing to do with rights.

    Sorry, that argument doesn't wash. It is quite possible to be a safe,
    polite, state-of-the-art ham operator without knowing code. The skills
    required are intended to be applicable to the license you're obtaining.
    You're describing a skill like the correct method of hand-cranking your
    engine. A worthwhile skill, to be sure, but hardly necessary to be good
    ham. Why not recognize that technology and times have changed? No one
    says that antique car ownership, restoration and driving are not valid
    pursuits. But requirements? I think not.

That's funny......this is only true on my '209 when the transmitter is
keyed from the PTT bar on the side. However, when the transmitter is
keyed from the mic jack everything works great - packet, headset&PTT,
hand mic....with all these, the internal condenser mic is deactivated.

To be blunt, because the bulk of the amateur packet community is still in
the dark ages, and part of the reason is that they've turned into
"appliance operators" who don't care about better technology because
what they have sort of works. There are hams working with digital signal
processing, spread-spectrum packet, TCP/IP, etc., but the appliance
packeteers aren't very interested.

> Besides, is this really against Morse Code, or are we simply trying to lax
>the rules because the 'New' generation is just to damn lazy to learn the stuff

Most of the "Old" generation probably can't make their own capacitors or
scratchbuild a spark-gap transmitter either. Not that they couldn't learn,
it's just that such skills are irrelevant to modern radio. Same situation.
The problem with Morse is not that it's hard to learn -- although it does
intimidate people -- but that it's one more component in ham radio's image
as boring and obsolete technology. If amateur radio is to attract new

people, and keep its large amount of extremely valuable and increasingly
scarce spectrum space, it is going to have to move back into the leading
edge of technological innovation, and soon. If that means dumping some
old stuff off the trailing edge to encourage people, it's worth it.

     You missed the point. It matters not whether you call access to
     spectrum a right, priviledge, or divine providence. What matters
     is that it is a resource that is managed on our behalf by government,
     and government is at least in principle functioning for the greater
     good of all citizens. In this vein of thinking we all have equal
     "rights" ie the government is as much about representing you as it
     does me or anyone else. Thus I reject any excuse that ARS is
     a priviledge that somehow makes us more equal under the law than other
     citizens. For the average (what we might call appliance operator)
     person the exams probably function more as a quota mechanism than
     what we would like to think it *actually* functions as, ie some
     sort of guarantee that the examinee will know how to cut a dipole
     or build a transmitter.

>to the no-code side. (the pro-code side says we should keep the old

>method in the test, even tho many drivers will never use it) It has
>nothing to do with rights.

     The code/no-code argument is pointless w.r.t to my posting. The
     premise of the argument I am forwarding is that they are
     better ways (in terms of benefit to society) to spend the 200 mHz
     or so of spectrum we are currently assigned between 50 mHz & 3 gHz -
     from whatever angle you care to argue from, be it public service,
     service to society, training of technical workers, etc.

>   pursuits.

        No, Scott. I said "hand SIGNALS". You know full well that "hand
cranking" bears closer resemblance to spark gap. And there you're right,
spark gap is a valid pursuit, but not fairly inflicted on the rest of us.

        But guy I said hand signals. And that comes to an acceptable end
for the no-code faction: hand signals are NOT optimal on the freeway,
where electric turn indicators work just great (if the bozo in front of
you has his in working order and will USE them!). Are hand signals still
part of the driving test in your state? It probably varies.

        Perhaps you misunderstood me; perhaps deliberately. Chapping
the pro-code faction like that just adds fuel to this stupid fire.

No, that's fine (leaving 2m out). 2m's overcrowded anyway, and there
ARE still people who do weak signal modes (meteor scatter, etc.) down
there. Get 'em up to 220 and 440. Matter of fact, I'd like to see
a 'weak signal modes' reservation against the communicator class on
the bands they are allowed access to as well. We do something like
this for the CW folks down below 30Mhz, so why not here for the
moonbounce folks?

  Subject: More info on Wilson & Packet

         More notes on Wilson HT's and packet: Pin 5 on my 1405SM
         does make it's way to the squelch circuit. The PK-88 that
         I use has a CSMA (carrier sense multiple access) circuit,
         so by connecting pin 5 from the HT to pin 7 of the PK-88
         and by setting the Squelch ON in the PK-88, the PK-88
         should pick up the HT's positive going squelch voltage.
         Comments? Tnx. Mike, WB3CPF@N2EYR

         1834z, 884 msgs @WB2GTX the PARC ROSErver, Secaucus, NJ >
```

for reference, here's a copy of the previous Wilson on packet posting:

If your interested in putting your old Wilson HT to use in the packet mode and do not have the schematics, here is some information that you may need.

The spkr/mic connector has 6 pins and 5 locking tabs (which guide the connector into it's socket on the HT). The tabs are pattered such that there is one large tab by itself and the other four smaller ones in two groups of two. The pin next to the large tab is #1 and #2-6 follow clockwise.

Function	Pin #	Spkr/mic* wire
Mic	1	red
Speaker	2	white
PTT	3	blue
Ground	4	black (shield)

*Note that the spkr/mic I'm referring to is the Wilson and that pin #6 is empty and #5 is wired but not used in the spkr/mic nor necessary for packet.

I am successfully using the Wilson 1405SM (5Watts) on packet with a TXDelay of 230 msec (so far). I added an open circuit female jack to the battery pack for charging and external power supply. To avoid cutting the connector off of the spkr/mic for the TNC connection, I put 2 closed circuit jacks (a mini and a sub-mini) on the spkr/mic casing so that I could keep it as a spkr/mic and receive plugs from the TNC. The closed circuit type jacks disconnect the spkr and the mic when the TNC is plugged in.

Any further info or response is welcome at
WB3CPF@N2EYR. 73, Mike.

I have the latest issues of NET from PE1CHL. These are modifications of the KA9Q TAPR distributed software with other features such as MHEARD and an AX.25 Conference Bridge. Also in the latest release is mulitport TNC support (KPC4) - yes multiport NET on a KAM. Also there is support for the DRSI PAcket adapter.

To get all of this, do the following:

Send 2 740K 3 1/2 ins MS-DOS Formatted disks with a self addressed mailer and postage to the address below. Also please enclose a note stating what you want. Send the whole kit to:

Julian Macassey, N6ARE
742 1/2 North Hayworth Avenue
Hollywood
California 90046-7142

I know almost nothing about this software, I am merely distributing it. It does come with docs and I can direct you to users who may help you.

I was wondering, what exactly is packet radio? How does it apply to ham
radio? What are the packet license classes? Are they different from ham

radio licenses? What is the minimal equipment needed to start a packet
radio station?

Sorry, folks. The last time I was on a rig was over 15 years ago in junior
high school. (Back then, the Apple II computer was just introduced and only
schools could afford it!)

Someone.
I'm hacking around with FEC systems for PR since quite a while.

There will be no simple 50$ approach but the
draft for a 1200 bps modem replacement for TNC2s is allmost finished
(extd Golay FEC, adaptive equalizer, PSK modulation, auto tune
facilities). This should even work on noisy SW frequencies.

My actual problem is to find out the address of an IC vendor.

I'm looking for
Space Research Technology Inc., Thousand Oaks

Their european branch has moved/ceased to trade. So could someone
please help me to find out their address
(if the company is still alive).

If my question has already been answered on this net, please excuse!

I'm thinking about buying the DRSI TNC board for an XT and would very
much like comments, both positive and negative, about doing this.
That is, do people recommend it or not.
I would, eventually, like to run 56kb or 9600 baud packet and, in my
understanding, I think this is the way to go.

Is there something(s) that a higher priced TNC-2 clone has that this

doesn't, except, of course, the multiport KAM?

Thanks in advance,
Joe Skoler, SKOHC@CUNYVM,   kc2yu@kc2yu.ampr.org [44.68.0.56] - soon

> I was wondering, what exactly is packet radio?

     Every now and again, someone posts an impassioned plea here for help or info on getting into packet, or learning the basics. The best thing to do is get in touch with local hams, who can hold your hand and direct you to local resources. They can also show you working hardware and answer questions immediatly. If you are in Patagonia and see this newsgroup via your own satellite link, then you probably won't have any local radio amateurs.

     Joining a local club. Info on local clubs and societies is available in most public libraries in most of the countries I've lived in. If you are at any US educational instutution, the odds are pretty high that there is a club on campus. Look for the antennas - Usually in the science end of campus - and ask around.

     To get you going on the basics, there is an article on packet in the December 1989 edition of BYTE Magazine (Page 363).

     Reading this newsgroup will also help as you will pick up bits and pieces. You can also either ask specific questions of the group or pick on individuals to answer questions.

     Yes, if you want to call or e-mail me about getting going, please feel free.

Yours

Packet radio is simply the transfer of data via modem. It's a bit more
complex internally that normal telephone modem transfer, in that it uses
a network datagram-type porotcol adapted from the X.25 standard. (called
AX.25 for Amateur X.25) Instead of the modulated signal medium being
a telephone network, a radio is used. All that is needed is a terminal,
a radio, and a Terminal Node Controller. (TNC) The TNC is the modem, and
includes a Packet Assembler/Disassembler (PAD) The "packetizing" of data
sent via the TNC is transparent to the user, and can be easily made to
operate just like a regular phone modem to the terminal. Personal computers
are often used for terminals.

So, there are BBSs running on packet radio, just as there are on phone
lines. Of course, subjects are limited to non-commercial, etc.

Baud depends on the band, with 1200 baud prevalent on 2 meters. A large
international packet BBS network exists, and is fairly reliable.

I suggest getting a book or two about the subject.

BTW, the apple II was not available over 15 years ago. That would be
pre-1975. You are off by about 3 years. ;-)

Several years ago K9NG published a design for a specialized modem for 9600
Baud operation on some Hamtronics radio modules. I would be interested to
know if any major changes have been made to his design. I would also like to
obtain a PROM listing for the state machine portion of his design if anyone
would be kind enough to send me a copy.

I am aware of the 56KB modems available through GRAPES, but I am specifically
interested in the K9NG design because it is so simple. Thanks & 73.

Rich and others:

OUTSTANDING. You've got it almost completely correct. Your one error
is in the red green blue bit. Notice from your photo that the
beginning is the sync. AT the end of the line is the colorburst. This
is a straight NTSC picture that has been digitized by a board that fires
on the vertical sync. The picture you have put up as a postscript file
is WEBER Photo-9 and is picture of the limb of the earth. The satellite
is still spinning down and even though it takes only a 30-th of a
second for a NTSC frame, how many of you have tried hand holding a camera
for a 30-th of a second still shot? As the bird slows down and locks
magnetically (the rest of them have just done this and WEBER has greater
moments of inertia and more mass to despin and lock), the pix should not
smear as this one has. In your Postscript photo, any detail was washed
by this spinning other than the atmosphere along the earth's limb is
clearly visible. You should see it in color ;-). Soon, soon. Rich,
I will post the color decoding formulas so that you can do a little
trigonometry and recover the color information. The lines are NOT
sent alternately RGB, it is NTSC (Bleeccchhhh!).

Great work!!!

Bob

I am reposting this because judging by the mail I receive, no one
has seen it:

    The latest PE1CHL release of KA9Q's NET is now available for the
Atari. It is available direct from PE1CHL, but those net fans in
the US can obtain it locally. Here is what you need to do:

Send:

1   Disk Mailer with your address and adequate postage
2   Double sided diskettes (or 3 single sided)
1   Note stating what you want

    Send the package off to:

Mike Curtis, WD6EHR
7921 Wilkinson Avenue
North Hollywood
California 91605-2210

Yours

* SAREX-2 TESTING CONTINUES *
============================

HR AMSAT NEWS SERVICE BULLETIN 049.01 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 18, 1989
TO ALL RADIO AMATEURS BT

Shuttle Amateur Radio Experiment #2 Undergoes Testing in Huntsville, AL

This week the Shuttle Amateur Radio Experiment #2 (SAREX-2) packet radio station underwent extensive testing at the Marshall Space Flight Center in Huntsville, AL according AMSAT Area Coordinator Ed Stluka (W4QAU). This testing was being perfomed in conjuction with the training of STS-35 Payload Specialist Ron Parise (WA4SIR) in the use of the ASTRO-1 experiment which will be primary payload on that shuttle mission. The primary payload, ASTRO-1, will be used to conduct a number of astronomical experiments. During the several days of testing this week, radio amateurs in the Huntsville area were invited to connect to WA4SIR and to receive a QSO number.

This special packet radio station flying on STS-35 on May 9, 1990 will give each radio amateur who connects to WA4SIR a QSO number confirming their contact. When the connecting station sends their QSL card in with this contact number, they will receive back a beautiful QSL card commemorating this HAM IN SPACE shuttle flight. The SAREX-2 packet radio station consist of a Motorola 2M FM H/T with 5 watts ouput, a Heathkit HK-21 TNC-2, and a GRiD laptop computer that has a 40 MB hard disk drive to store the calls of all the stations connecting to WA4SIR during the nine day mission. The specially written software which will be running the SAREX-2 packet station is designed to allow for completely unattended operation and logging of the calls of all connecting stations. It will also prevent duplicate QSO numbers being sent! Although no digipeating will be allowed through SAREX-2, connecting to this packet station will be like any terrestrial packet contact. Just use your TNC along with your 2m tranceiver, and everything else is the same. After you have connected and received your QSL number from WA4SIR, on subsequent orbits you can watch for the SAREX-2 message beacons being sent periodically. The message beacons will contain information about the flight of STS-35 and other interesting items.

Look for more information about the SAREX-2 mission in AMSAT News Service (ANS) bulletins and on AMSAT HF/VHF nets in the next couple of months. For more specific information about the ASTRO-1 payload, contact the SPACELINK BBS at (205) 895-0028.

>something than the rest of the country?

Bob,

The only real reason people like Dave and I are talking about efficiency in the first place is to counter the false claim by the anti-no-code crowd that every ham must be required to learn it "because it's the most efficient (or effective) communication technique". I certainly don't want to "go after" someone else for not using the latest, most efficient technique, at least not when so much of our microwave spectrum lies fallow.

On the other hand, when a band reaches capacity, perhaps some changes *are* in order. After all, spark used to be king, but now it's not even legal...

It is a shame that this flight won't be during the normal school year
(for college, that is... at least, not here at Clemson). Anyway, has
there been any announcement of the frequency that will be used for the
SAREX packet station? Also, will any normal antenna system work (like
for the DOVE) or would a special one be needed (like a turnstile).

comp.protocols.tcpip.ibmpc (I hope thats right, it might be ...ibm-pc)
deals with
TCP/IP products and problems from the DOS side. It has many knowledgeable
people pop in with help for users, including Phil Karn (developer of KA9Q)
occassionally.

Actually, I wasn't aware that KA9Q ran in unix boxes (I thought it was just for
DOS systems), but I'm pretty sure the folks over in c.p.t.i can help.

I understand the German group NORD><LINK has an OSK (OS-9/68K) port of

KA9Q's TCP/IP code. Does anyone know of a source for the code?

I am also looking for a source for NORD><LINK's update of WA8DED's firmware

for the TNC-1. I believe it is called The Firmware.

Are either of these file requestable from somewhere?

I would appreciate e-mail replies as I don't get to check this newsgroup as

often as I would like.

AdvTHANKSance for the help. :-)

Subj: correct protocol

I have been told there is an erroneous description of the picture protocol published on Compuserve. To avoid the possibility of people wasting their time with it, below is the correct, complete description.

The format of picture data for the camera color composite signal is as follows:

Callsign (for this transmission scheme) is PHOTO (for the camera). SSID is picture number (modulo 16). We are currently often overwriting a given picture number with different pictures perhaps twice a day. This is done when a picture is clearly black and there is no point in getting all of it.

The first two bytes of data portion of the UI frame (packet) contain the 10-bit X position of the first sample in that packet, the two most significant bits of the X position occupy the two least significant bits of the first byte, the eight least significant bits of X are in the next byte. Legal X values are from 0 to 644. Y values are in third byte and range from 0 to 241. If the two least significant bits of the first byte are both set (forming an X 768..1023), the data beginning with the second data byte is clear text information about the picture (which we call the "picture header") occupying 252 bytes. The six most significant bits of the first byte are reserved for future protocol definitions, only one of which is presently defined.

The data then consists of a sample for every third X value. This has little to do with RGB, but is relevant to color as the NTSC waveform is sampled at precisely 3 times the color burst frequency. A zero byte value indicates a simple compression sequence as follows: 00, the count of repeats, then the value repeated. Actual samples with a value of 0 (hor. sync) are changed to 1 to allow indicating a following compression sequence. When the X value is greater than 644, increment the Y value by two and subtract 645 from the X value. At the end of one of these compression passes, encoding returns to the top of the pic, moves one byte to the right and proceeds. This takes place three times to complete one half pic (every other line). Alternating half pics (even vs. odd) lines are transmitted every 101 minutes (every other visibility pass at these latitudes). There is not vertical sync transmitted. The picture begins at the end of the header.

The 645th byte of a reconstructed line is the count of zeroes which was in the original digitized sample between the 644th byte of that line and the beginning (the first non-zero) of the next line. If you are reconstructing the original waveform replace that count byte with that many zeroes.

I must again emphasize that this protocol is very temporary and can be expected to change with little advance notice. The compression scheme is poor and was selected only for its simplicity. It also will change. These changes will be handled with Weberware version updates. Also, please note that we have the ability to download individual R, G or B signals from the camera and their protocol may be different. Ditto for the 1.2 GHz experiment. For those, however, you can expect a bit more advance notice of variation.

As of today, only one picture has been arguably of the earth. We have been taking pictures (15) for only 8 (12 of our 15 on the first day) days now and it will require time to polish our procedures. We are concentrating on the equator now because pre-launch projections suggested potential problems at high latitudes. The first 12 pics were over the U.S. and none were of the planet. We have taken one pic at night (in the dark) to characterize performance. Two interesting tidbits. Shots that turn out to be of the sun don't move the impact sensor because, presumably, the iris is stopped down and has little distance to spring closed. Deep space photos increment the impact sensor considerably. The second tidbit has to do with the night photo. It

has an average light level much lower than even the deep space photos taken during the day. Perhaps a little atmospheric glow around the spacecraft even at that altitude?

     Thank you all for your interest.

73's,
Chris, WA3PSD, WEBERSAT project leader

P.S. Photo 1 is a pretty good shot of straight down over the ocean. A large cloud bank is visible against the blue water. It does NOT look like much in B&W. I can tell you from experience, VGA is required, the EGA displays suck. AMSAT will be distributing WEBERWARE, color black and white display stuff with a decompression routine.

Bob

Does anyone have any comments on the new Kantronics dvr2-2? This little unit does 2 meter FM and packet in one little box, including the 2 Watt transmitter. All I need to add is the RS-232 cable to my terminal and I'm on packet!

I realize it only has two crystal controlled channels, but I would just be using it to monitor a DX Packetcluster, rather than tying up my other equipment. Suggested retail price is U.S.$ 239.00 which is a lot cheaper than I can buy a separate

TNC and 2 meter transceiver.

Looking forward to knowing if anyone has already tested one.

The advertising I have soon on the DVR2-2 do not indicate that it is
a rexxxx radio/tnc combination....just a packet optomised radio.
The $239 price can be beat at Ross Distributing in Idaho.
Check QST for phone #.

Hello All,

I have just moved the WB3FFV BBS to it's new location, and this has forced me to change the phone numbers. Please see the attached message below for the various capabilities and the new dialup telephone numbers...

+--+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)

Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700 Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.07)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

I was wondering if anyone has had some experience with setting
up an HT on packet. My equipment is as follows:

      MFJ 1278 Multi-mode Controller
      Santec ST-20 T handheld

The MFJ has 5 leads corresponding to 1) mic input; 2) ground 3) PTT
4) Receive Audio; 5) Squelch input. My first attempt at making the
connections involved the following steps: 1) I connected the mic input
lead to the center conductor of the mic plug going to the radio;
2) I connected the PTT lead to the outer conductor of the mic plug going
to the radio; 3) I connected the receive audio lead to the center
conductor of the speaker plug going to the radio; 4) I connected the
ground lead to the outer conductor of the speaker plug going to the radio.
I seem to be able to receive fine, but when I insert the mic plug into the
radio, the transmitter appears to key on and stays on.

The manual suggested one of 2 options when dealing with HT connections.
The first (and easiest, I thought) was to install either JMP K or JMP L.
Apparently this amounts to opening up the controller and soldering a wire
across two nearby points on the printed circuit board. After doing this,
the radio appeared to be dead-no receive at all. The second option is
using an AF transformer with a "low turns ratio". The instructions are not
very clear on exactly what is needed and where the connections should be
made.

Any suggestions would be greatly appreciated--I am anxious to get on VHF
packet and this is my major roadblock. Thanks in advance for your help!

         John - WK8A

Yea, yea, yea. I hear this all the time. I even have a copy for a DOS box
and an Amiga. But where can you get the SOURCE? Preferably with a unix
make file. I have two unix boxes up and running and two more I'm going to
ressurect. How am I going to run tcp/ip on them with DOS binarys?

Michael

I've put together the following listing in response to requests here on the net for information on amateur radio programs for the Macintosh.

This is a one-time posting on my part. If someone would like to volunteer to keep this information updated, I'd be happy to send him or her the background materials I have. It would be even better if that person was also on packet radio; when I had a packet system up and running, I noticed frequent Macintosh questions there, too. (If anyone wants to post this listing on packet, go ahead. But I'll leave it to you to take out the prices, divide it into smaller chunks, etc.)

Please note that I am not endorsing or recommending any of these programs. In fact, I've only seen a few of them. The information in this list was gleaned mostly from flyers supplied by the software vendors, or in some cases from reviews or listings in QST or AMSAT Journal. Please check with the vendors for the latest product details, pricing, etc.

And--this should be obvious--this listing has absolutely no endorsement by Apple Computer, Inc.

Having said all that....enjoy!

73,
Patty

****
Macintosh Amateur Radio Software
List compiled by N6BIS, 2/25/90

PACKET RADIO

NET/Mac (KA9Q TCP/IP)
Supports AX.25 and NET/ROM as well as TCP/IP functions. Requires a TNC with KISS mode.
     Doug Thom, N6OYU, 1405 Graywood Drive, San Jose, CA 95129.
Send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer. Also available via anonymous FTP from apple.com (/pub/ham-radio); on the Digikron Systems BBS at (408) 253-1309; and on the WB3FFV BBS at (301) 625-0817, 625-9482, and 625-9663. The program is copyright, but free for noncommercial use.

MacRatt with FAX
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes computer-to-TNC cable.
     Advanced Electronic Applications (AEA), PO Box C-2160, Lynnwood, WA 98036. $59.95

MORSE CODE PRACTICE

N6MZV Morse Trainer
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014.
Also available via anonymous FTP from apple.com (/pub/ham-radio).
$25.00

Morse Tutor
Jack Brindle WA4FIB, Brincomm Technology, 3155 Resin Street,
Marietta, GA 30066. Send formatted 800K Macintosh disk with
stamped, self-addressed return disk mailer. The program is copyright,
but free for noncommercial use.

MacMorse
David A. Kall, 700 Marine Parkway #314, New Port Richey, Florida
34652. $29.95

Zihua Morse
Zihua, P.O. Box 51601, Pacific Grove, CA 93950. $39.95 without
speech synthesis; $65 with speech synthesis.

RTTY

MacTTY
Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.
$39.95

LOGGING

LOGic
Personal Database Applications, 2634 Meadow Bend Court, Duluth,
GA 30136. $75.00

FDLog!
System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN
55443. $29.95

SATELLITE TRACKING

QuikMac
AMSAT, PO Box 27, Washington, DC 20044. $40 for AMSAT
members; $50 for non-members. Requires Microsoft BASIC.

Satellite Orbit Prediction Program
Macintosh conversion of W3IWI program.
Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015.
Send formatted 800K Macintosh disk with stamped, self-addressed
return disk mailer; or send SASE for source listing. Requires
Microsoft BASIC.

MacSat
BEK Developers, 1732 74th Circle NE, St. Petersburg, FL 33702.
$10.00

Satellite Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $59.95

Satellite Pro
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $99.95

PROPAGATION, GRAY LINE, DX HEADINGS

DX Window
Creates on screen an azimuthal equidistant projection (great circle) world map centered on your QTH, with day/night terminator.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95

Skycom 1.1
Enter solar flux and get propagation predictions to desired areas of the world.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95 ($59.95 with Skycom 1.5)

Skycom 1.5
Provides sunlight status at both ends of the path; MUF, F0F2, and FOT frequencies; S/N ratio of the link, and other information.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95 ($59.95 with Skycom 1.1)

DX Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98336. $34.95

Sun Clock
Desk accessory. Displays a map of the world with day and night areas.
MLT Software, PO Box 98041, 6325 SW Capitol Highway, Portland, OR 97201. $17.00

RADIO CONTROL

ICOM IC-735 Control
KE6FG Software, 9763 Pali Ave., Tujunga, CA 91042. $49.95

TEST PREPARATION

Ham Stacks
HyperCard stacks containing all of the questions in the current question pool for each license class.
Diana Syriac N1GZS, 49A Meadow Pond Drive, Leominster, MA 01453. Send two formatted 800K Macintosh disks with stamped, self-addressed return disk mailer. Also available via anonymous FTP from

apple.com (/pub/ham-radio).

COLLECTIONS AND MISCELLANY

"Project Mac"
Contest logging, antenna design, satellite tracking, clip art, etc.
Microsoft BASIC required for many (but not all) of the programs.
     Stan Horzepa WA1LOU, 75 Kreger Drive, Wolcott, CT 06716.
Send three formatted 800K Macintosh disks with stamped, self-
addressed return disk mailer.

Amateur Radio #1
Contains satellite tracking, Morse code practice, Ohm's law calculator,
and pad design programs.
     Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

Red Ryder 9.4
Terminal emulation program, suitable for packet radio.
     Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

MacScience BBS
Various ham-related applications, including antenna design,
propagation, WEFAX, packet, and Morse code. (408) 866-4933.

Digikron Systems BBS
Various ham-related applications, including logging, propagation,
Morse code, and packet. (408) 253-1309.

WB3FFV BBS
Various ham-related software, including packet, contesting, and Morse
code applications. (301) 625-0817, 625-9482, and 625-9663.

MacNet
Public-domain programs (currently on nine disks) contributed by
Macintosh packet users. Includes test preparation, contest logging,
propagation prediction, satellite tracking, and amateur television.
     John D. Seney, KB1HE, 144 Pepperidge Dr., Manchester, NH
03103. Send formatted 800K Macintosh disks with stamped, self-
addressed return disk mailer. Contributions of public-domain
programs encouraged.

I've decided that I'm going to buy a TNC, but I am new to the world of
packet. I'm going to be using my Apple][+ to control the the TNC, and as
far as I know, there doesn't exist any programs for my machine.

Therefore I need fantastic documentation so I can write my own. I don't
mind writing something, I just need to know how to access the commands
on the TNC.

My question to the net is "Who has the best documentation?"

One of my friends has a MJF 1270 (I think, it's the cheap one). I
wasn't impress with the documentation. Can I get some opinions on
AEA's documentation? Does MJF give better documentation with the more
expensive models?

Thanks.

I don't know what to tell you, except I have a similar set up and VERY similar problems! My radio occasionally locks up on transmit and I don't find out about it until I notice the DCD light isn't lighting up. I check the handheld (we have the same one-ST-20T), and the sink is hot! The only way I can cure this is to pull out the plug and stick it back in.

I've heard numerous reports. Most say it could be RF getting into the TNC or vice versa. Although we have the same radio, my TNC is an AEA PK-88.

If anyone knows more, please let BOTH of us know. I have no idea really why this should be happening. Thanks alot, 73's, Mike, N7MSD

> This little unit does 2 meter FM and packet in one little
> box, including the 2 Watt transmitter. All I need to add
> is the RS-232 cable to my terminal and I'm on packet!

I purchased one of these rigs to get a full time PBBS up and running. You also need to buy the TNC. As a previous reply stated, it is just a packet-optomized radio.

After installation, I found that the 2 watt (more like 1.5) didn't hit very much (only one node). Also, I live nearby a repeater, and whenever the repeater was transmitting, the dvr 2-2 was desensitized and wouldn't receive. Lastly, when you add crystals you need to re-tune the rig. To set the radio up for the two channels I wanted would probably put me over the $300.00 limit I wanted to set for the

rig.

The Alinco 110 is a 5/45w mobil rig that was on sale for $299.00.
I returned the dvr 2-2 and went for this. The 2-2 was a sexy
little rig and it was just the ticket for me at the time, but
the fairly high cost in combination of low power made it a
dissapointment.

Mom told me not to volunteer...but I didn't listen 8-).

I volunteered for program chairman for our local ham club at work - we have a
monthly brown bag lucheon meeting. I'd be interested in hearing suggestions
for topics/speakers that have been successful with your groups.

e-mail direct and I'll summarize

What you are describing could very well be RF getting back into the
tnc. I have the exact same problem with a kpc-2 and TH-215. When I
operate portable with the duckie, the transmitter sticks on. As soon
as I pull the plug, the tnc resets, strange. I have found that if
the cable from the radio to the tnc is parallel to the antenna, it
happens everytime. One solution is to keep the cable away from RF.
The best solution would be to have a well shielded cable (and tnc).
Hope this helps.

Hmmm, seems to me I just dealt with this question last week... :-)

Anyway, for Matt and anyone else who is thinking about using any computer
with any TNC (is that general enough? :-)), all you need is *a terminal
program*. Yes, it's that simple! You don't need a "packet radio" program.
Use the same program you now use for telephone BBSs.

Before I switched to TCP/IP, I was using MacTerminal for packet radio.
That or any other terminal emulation program is fine on the Macintosh.
Any Apple II terminal program will be fine on that machine. Any TRS-80
terminal program will be fine on that machine. Any C-64 terminal program
will be fine on that machine. Shall I stop now? :-)

Please forgive me if you've all heard (and answered) the following
questions before, I'm almost sure you have - but I don't read this
newsgroup very often and would appreciate any help.

I have just inherited an old TNC-1 and want to run it in KISS mode
with the KA9Q package. The radio will be a Wilson VHF HT. The
KA9Q documentation mentions that the KISS firmware for the TNC-1

can be installed two ways. The first is by installing a stand-
alone EPROM available from TAPR and the second as a downloadable
something (file?).

Regarding the first method, could anyone please provide me ordering
information for the KISS PROM from TAPR (how much is it, what's
their current address, etc.)? The TNC currently powers up with
AX.25 level 2 version 3.2 - how current is this?

Regarding the second method, is the KISS firmware available as a
downloadable file? If so, can it be FTP'd from somewhere? Do I
use the TNC's debug command to load the bytes in or do I have to
burn it into my own EPROM?

Also, the Wilson HT uses a small 6-pin screw-on mic connector.
Anyone know where one can get the mating plug for this connector?

Lastly, which of the popular PC BBS programs will allow multiple
TCP/IP connections through either a LAN or TNC?

This is part of a project to setup an Internet/AMPRnet gateway at
the University of Hawaii. If anyone has done something like this
before, I would appreciate hearing from you. And if there any
Hawaii-based hams reading this, your thoughts on the idea would be
be very much appreciated.

Replies may be posted here or e-mailed. Thanks in advance!

The Unix version of the KA9Q TCP/IP software package is available with
anonymous FTP from host vax.cs.pitt.edu in the file pub/ka9q/net-unix.cpio.Z.

On the last two evenings, FO-20 has passed by with the digital beacon
telling me that all is well and ready for use, but there has been NO
other activity - and no one I've talked to has been able to connect to
it at all.

Has it wedged in some way?

Hi Brian:

Nice to connect with you on LUSAT! To answer your question, I also thought so and then I went back and read an announcement (holy changes Batman and announcement on a FUJI operational change?!?!?) that said they would be doing something with the JD experiment that would cause it to dump the message memory (my guess is whole orbit data scans) and they gave the data. It was fully operational this morning and I left you a message on it.

Bob

One program that we(the local Amateur Auxiliary) are putting on for
anyone that is interested is a combo program where we talk about
the Amateur Auxiliary(OO's) and also talk about DF techniques.
The DFing part seems to be a real popular topic. The meetings
seem to run a bit long because there are usually so many questions.

Try contacting your local OO Co-ordinator(get his name from your
ARRL Section Manager) and maybe he can help you find a speaker.

In my area, there are a couple of linked voice repeater systems and

several packet networks. The repeaters are linked on VHF and UHF
with conventional FM tx/rx. The audio quality is OK if there is
only one hop between the originating and receiving repeaters, but
gets very poor if the repeaters are at opposite ends of the state.

On packet, the situation is not much better, now using 1200bps
dedicated uhf backbone and/or vhf frequencies which are shared with
the node users. To communicate with another station a few nodes
away, it may take minutes for each packet to reach its destinition.

ISDN (Integrated Services Digital Network), is a new network protocol
which aims to handle both voice and data (including X.25). Hardware
(and probably software) are or will be available to facilitate an
ISDN. It seems to me that ISDN running over a few microwave links
would solve both of our linked repeater and packet problems. This is
something the Amateur community should be on the leading edge of.

Does anyone know of any Amateur experiments planned or underway
involving ISDN? Please reply to me - any replies, I'll summarize to
the net.

     I don't have it available for ftp. You can get it from the
address below. I am talking to TAPR re their carrying the

software too. Plus of course some public spirited individual
could get the disks and upload to one of the popular ham sites
and let us all know.

    The latest PE1CHL release of KA9Q's NET is now available for the
Atari. It is available direct from PE1CHL, but those net fans in
the US can obtain it locally. Here is what you need to do:

Send:

1   Disk Mailer with your address and adequate postage
2   Double sided diskettes (or 3 single sided)
1   Note stating what you want

    Send the package off to:

Mike Curtis, WD6EHR
7921 Wilkinson Avenue
North Hollywood
California 91605-2210

Yours

ISDN is much too litle and far too late (IMHO). I want a few 10Mb/sec
lines coming into my house.

Recently I saw Dr. Robert W. Lucky here at USC. Dr. Lucky writes the
Reflections column in IEEE Spectrum. In his talk, Dr. Lucky mentioned
quite a few interesting things:

1. More than 98% of your telephone bill reflects the cost of
   sending you the bill and keeping track of the accounts.
   Almost none of your bill goes to maintaining the equipment; the
   telephone companies are in the _service_ industry.

2. Over the past few years, the bandwidth capability of the
   technology has risen at a phenominal rate, while demand for
   bandwidth has remained constant.

Some of Dr. Lucky's suggestions were:

1. Give people HI-FI voice lines.

2. Give people wide bandwidth data lines.

(Note that the cost for both of the above is near zero! See above.)

3. Allow the phone companies to provide cable-tv type
    entertainment. (Dr. Lucky suggested that what he wanted was 40
    or 50 'channels' all playing the same movie continuously, but
    starting about 5 minutes apart. You could start when you
    wanted, go to the kitchen or bathroom and then switch 'channels'
    to pick up where you left off. This would be quite
    convenient.)

ISDN is a good idea, but it is very old technology. We should have had
this years ago. Let's take the idea of ISDN, (which is basically a good
idea), and update it to reflect current technology. I want a few
10Mb/sec lines coming into my house.

Hello all...

I have just added a KPC-2 to the shack, along side the PK-232 and was
wondering if anyone had experience with (PC) software that works with the
KAM KPC-2. There are a lot of these around for the PK-232 but
I can't seem to find anything for the KPC-2. I've already looked
on CompuServe.

I know Kantronics sells something for around $60.00. Does anyone
know if this is worth it?

Thanks,
Gene - AA6IY (AA6IY@N6LDL)

YES, YES, YES. You can receive DOVE with a 2m (145.825Mhz) FM radio hooked to a TNC (I use a Kenwood TR7850 and a Heathkit TNC-1 in KISS mode, with Phil Karn's TCPIP package, which I use for other reasons). All you need to do is set your radio to 145.825 and turn the 'monitor' on your packet radio program on. I capture the stuff into a file. If you leave everything on for 24 hours, you WILL get telemtry from DOVE, maybe more than once. (I usually get 2 successive passes, twice a day, for four occurrances). Each pass lasts from 2 to 8 minutes decodable telemetry.

I also use a quarterwave groundplane in the attic as my antenna and it works great. It's really neat listening to FM with a doppler shift!. (The demodulator in the TNC seems not sensitive to the doppler, by the way). You might try a better antenna on your handheld than the 'rubber duck' it comes with, but the receiver in there is more than sufficient.

DO NOT TRY TO TRANSMIT TO THE BIRD, it doesn't listen on this frequency, and it just screws up everyone else. Also, turn the BEACON off in your Packet radio program first. (I have a collection of Beacon packets I'm making from my automated telemetry gatherning...)

If you have a computer, programs to tell you when the satellite is QRV in your area are available from AMSAT for reasonable prices (like $50 for InstaTrack).

Any more questions?

I've got a somewhat old Heathkit TNC - the HD4040. Basically a TNC-2 clone.
Using the heath-supplied proms, I'm behind the times. I'd like to be running
protocol version 2 (L2V2).

At one point, Heath started to make available 'DED proms for the beasts, but
stopped.. I have the facilities to blast roms - anyone have available for
mailing to me or available via FTP more recent code for my dinosaur?
Thanks..
     -Rick

I will post the equations for decoding the microsat telemetry. I forgot to bring in the status bits (but they are changing about once per week whereas the analog telemetry is NOT). This will all settle down soon. I apologize for this taking so long to get out.

        "Archaic" is an emotionally charged word. "Inefficient" is
not accurate. If you really wanted to solve the problem (without
disturbing all us "old farts") you'd teach your machine how to generate
and decode CW. People have actually made money off of such schemes
and I've thought up one myself (it was really an enjoyable excercise).

I managed to get a copy of this file and got it burned into a $2.00 "Swap Meet Special" CMOS 27256 EPROM. Note the EPROM in the u21 TNC is CMOS.

Yes, it works. You have to do the KISS ON, ABAUD 9600 etc. But it goes into KISS and runs tcp/ip. And yes, it works fine in regular AX.25 mode too.

I will supply this code and docs to get you going on and MS-DOS floppy disc to anyone doing the following:

Send me:

1 disc (5 1/4 X 360K or 3 1/2 X 740K)
A mailer for the above disk
Postage for the disk and mailer
A return address
A note telling me what you want: i.e. u21 EPROM Binary

Regrettably, I do not have a "gang-banger" or I would offer to supply PROMS ready to go.

Send to:

writes:
>[...] It's really neat listening to FM with a doppler
>shift!. (The demodulator in the TNC seems not sensitive to the doppler,
>by the way).

DOVE uses an FSK audio subcarrier on a FM main carrier. The radio's FM
discriminator sees the doppler shift of the main FM carrier, but the
TNC's demodulator sees only the audio subcarrier. It too is
doppler-shifted, but to a far smaller degree. This is because Doppler
shift is equal to v*f/c, with v = velocity, f = frequency and c = speed
of light.

Orbital velocity at DOVE's altitude is about 7.5 km/sec. Ignoring the
rotation of the earth, you see almost this much in relative velocity
when the satellite is on the horizon before or after an overhead pass.
(The doppler shift is max positive at the beginning of the pass, max
negative at the end). So on 2m, the max shift is about +-3.65 KHz. On
70cm, it's about three times greater: +-10.9 KHz, because the frequency
is three times as high. However, even at the higher subcarrier audio
frequency (2200 Hz), the doppler shift is only about +-0.055 Hz. I think
it's unlikely you'll see or hear this!

The TAPR/AMSAT PSK modems used to demodulate the 70cm signals tune the
radio to keep them tracking the changing Doppler shift throughout a
pass. This is a vital feature, considering that the PSK modems need to
be within a couple hundred hertz of the correct RF frequency to work.

Move to Canada. I have a digital ticket; no code (no privs below 2 meters, either, that's a nature preserve for endangered species :-) :-) :-); but from 2 meters up I can pretty well do anything I like. One is expected to know the regs and electronics at Amateur Advanced levels, and there is an essay-format exam on information theory and packet digitial techniques. The exam took me about 3 hours (I am slow at longhand).

I did have to study obsolete stuff, mind you - ALOHA indeed :-P.

Well, actually, YOU can initiate a new newsgroup. A very short
summary of how to do it is: Read the doc which is posted once a month
or so in (I think) news.announce.newgroups on how to get a newsgroup
started. Decide on a name, charter, if it will be moderated or not,
things like that. Announce, in news.announce.newgroups, a call for
discussion about the newsgroup. Start reading the newsgroup that
the discussion takes place in (news.groups, I think) and take part
in the discussion (or ignore stupid remarks, whatever :-)).

IF all goes well, then you announce a call for votes. (about 2 or 3 weeks
after the call for discussion). Count the EMAIL votes. Announce the
totals in news.announce.newgroups. If, after a month
of voting, you have 100 more yes votes than no votes, and a 2/3 majority
of yes votes (I'm hazy on the exact numbers, sorry), then you announce
that the group succeded and you send a message to Gene Spafford asking
him to create the group.

WARNING - read the details mentioned first before doing this, as I've
skipped a few details...

But don't worry, its not really very hard. I encourage you to
go for it.

I found an old (like, early 1988) copy of the KA9Q software package,
including stuff to make it work with SLIP (serial line IP) systems,
over the internet.

In the documentation included with that package was a comment that
this is the newsgroup where new versions are announced, but in scanning
the past couple of weeks of messages I didn't notice anything... can
someone tell me where the newest versions are, and how to set them
up? I looked on SIMTEL20 but couldn't make any real sense out of what
was there; what I need is something that will 1) dial the telephone
or provide a mechanism for doing so; 2) connect to a SLIP system
at the other end, possibly through a couple of steps of interaction
rather than just automatically being ready when the phone picks up...

Thanks in advance - please respond to me directly since I already
subscribe to about twice as many news groups as I can regularly read :(

My Webster's has the following for "archaic:"

1. belonging to an earlier period; ancient

2. antiquated; old-fashioned

3. that has ceased to be used except for special purposes, such as
poetry, church ritual, etc.

Precisely what I meant, especially 3.

"Inefficient" is accurate - there are lots more
bandwidth-efficient ways of encoding characters than via morse. I
draw your attention to the fact that no current organization or
system uses morse for any kind of serious communication where it
can be avoided.

And I yield to no one in old fartishness - I just happen to be an
old computer fart instead of an old radio fart.

Bill Owens (who is not a ham) said that he might be interested in getting
his license to play with packet, but he resents being tested on an archaic
code such as Morse.

What's the big deal about such a trivial clerical skill as demonstrating
your ability to receive Morse at 5 WPM? With the 5 or 6 hours a week

that he says he has to devote to radio, attaining minimal Morse skills should be easy . . . unless he resents Morse so much that he wont spend any time studying. I mean, I passed the test when I was 12 years old, for God's sake! Certainly a smart techie type should have little trouble with something so trivial.

There are many aspects to ham radio, and the exams try to cover some of them. If I had claimed that I wasn't going to take the test until they removed those silly questions about HF propagation, because I ONLY wanted to operate VHF, I would STILL be complaining like Bill, instead of having lots of great experiences as a licensed ham. Back when I got my license in junior high school, there were a couple of guys who had read some editorial in 73 about how we ought to have a code free license. They used this as a reason to wait, instead of learning the code. Well, they are still unlicensed, still waiting, and next month I will qualify for QCWA.

I will assume that Bill uses computers, as he left a posting on this network. Suppose that Bill had decided that he was going to wait on getting a computer, because they required that archaic clerical skill called TYPING. I mean, with the possibilty of voice response, why waste your time learning to TYPE, when you could WAIT instead for the rest of the world to change, instead of getting involved?

Granted, no one has to take a test before operating a computer.

Don't get me wrong . . . I am not against having a digital VHF license that does not require an examination on Morse skills. But I guess I don't see what the big deal is for all these guys that I keep bumping into who claim that they want to be hams, but really resent the code.

Also, I wonder what the effect of a Morse-free license would have on digital ham radio? Somehow I suspect that just like giving Novices HF voice, it may not have a substantial effect. And if it did cause a sudden increase in our ranks, what then? In our area, the VHF packet network is really supported by a tiny group of folks who put up hilltop nodes and run BBS systems. The network is then overwhelmed (and sometimes abused) by the rest of us. Will a code free license really have a good effect on that situation?

73,
Tad Cook

Looking for advice, references, etc:

I am trying to set up a small packet station to run on
2m, off an Icom IC-2AT, *just* for experimentation to see
how it works. Being a college student, I don't have any
money, but I do have an IBM AT with 2 serial ports, and
access to an Internet site (wpi.edu). Here's the thing:
Is there a purely software interface between my PC and
a modem that operates as a TNC, and if there is one,
where can I get it, and how many precious dollars is it?
Public Domain/Shareware is preferred of course (cheaper).

Also, I have a Racal-Vadic 300/1200 modem that is Bell-103
Compatible, but *not* Bell-212 compatible ... would anyone
know if it was indeed Bell-202 compatible (like the packet
station needs) or am I going to have to build (like I expect
to) a Bell-202 modem (like in the ARRL Handbook)??

Failing that, anyone wanna make a donation? :-)

73's,
John Whitson, KB2GNC

I got the KISS software for mine. I just got the hex images off a floppy sent me by another amateur in Europe. I've sent it out to several people, mail me a request if you need it, and can get it via electronic mail. On top of that I run both Phil Karn's program (KA9Q NETPC), or SUPERKISS, which is a terminal program written by a German amateur (his call is DL9MCQ). It's pretty good.

I also have the Wa8DED software (in PROM) that I bought from TAPR, but I haven't honestly used it. (I ordered it before I got the KISS stuff).

By the way, I'm looking to increase the speed of my TNC to 2400 Baud PSK, is this possible with the TNC-1 design? What about 9600 baud (for satellite work with the PACSAT's)?

Here we go again...

For those with short memories, the subject of spectral efficiency vis a vis
CW and more modern digital communications methods has been thoroughly
discussed in this newsgroup. Suffice to say that "caulkins@cdp" is
absolutely correct -- CW is *very* inefficient in both power and bandwidth
when compared to more modern digital modulation and coding techniques.

For those who want the details, search the archives.

Apparently a number of Yaesu HT's need an impedance network
to match and work with any of the common TNC's. I was wondering
if any of our illustrious readers have any experience with these mods
or can provide any pointers. Thanks a bnunch in advance.

The problem with learning morse is not that it is difficult, but
that it is intensely (to me, anyway) annoying to be forced to
learn something which has no cost-effective value in the real
world.

I've done a great many volunteer-type things, and, IMHO, believe
some of them have been useful to the efforts I worked for. NONE
of them has involved amateur radio (and many could have) because
of this barrier.

     [text deleted]

Tad, we're all citizens of the same country. Is there any reason the
government should afford you access to a very valuable resource and
at the same time lock out Mr Owens?

Perhaps the time is upon us where the cost/benfit ratio of Amateur
Radio is to be questioned more seriously, at first through small
steps (eg 220) and later through larger efforts to examine spectrum
allocation as a whole. It seems to me that the bulk of spectrum
assigned to ARS was arranged when it was not particularly expensive,
and even though we "own" it so to speak it is not clear we are able
to pay "taxes" on the allocation anymore. I for one feel that the
general needs of the public would probably be better served if the
FCC were to give one or more bands of amateur allocation over to a
Public Digital Radio Service and to increase cellular telephone coverage.
The former would satisfy the claim that ARS helps train technical
manpower (eg does society need more RF engineers or Computer Engineers),
and the latter would address the emergency communications element.
Even the claim that ARS is useful for technology development is
suspect since it seems hardly any of the technology developed recently
could not have been done faster or better if there existed enough
of a market to get industry interested. In others words, why should

Amateur Radio exist? In my mind if we are to continue to exist we need to get more people involved in the hobby, to make the hobby more useful to society (eg Phil K's loosening of content rules is a good idea), and to make it easy to buy into the hobby. Prima donna behaviour like taking pot shots at Mr Owens is exactly what we DO NOT need.

Back when the debate over "no code" was hot and heavy, one person responded at one point that he didn't want to see ham radio overrun by nerds.

Ever since World War 2, the United States has been on a decline in technical education. Sure, we made many great achievements during this period, but the decline was there nevertheless. Our educational system, and even our culture itself, is critical of people who show an interesting in technical things, or just have the intellect to think.

If someone can play football or some other sport well, they are greatly admired to the exclusion of all else. Someone who competes in a chess tournament or participates in a science fair is far less likely to get praise from family, school, and the community, for these achievements. How often do you hear school kids these days taking PLEASURE in telling their peers how POORLY they did on a test or in a class?

To turn America around, and recover the technical lead it has had in the past (and is now losing) we need MORE engineers, MORE scientists, and in general MORE people who are not afraid to think and come up with the right answers and create new ideas.

We also need to not be ashamed of being smarter.

I've uploaded a program I wrote to take trace files from KA9Q NOS
and decode Microsat telemetry data.

It can be found on tandem.com thru anonymous FTP. The file is in
hamradio/utlmd.arc

The program is pretty simple but does the job for DOVE, WEBERSAT, PACSAT
and LUSAT.

Enjoy !

In watching two passes on Sunday over Europe, I noticed that
one of the 6 solar panels never reported more than minimal power output.
If the satellite is indeed tumbling, I would expect all of them to
show variable output, as the other 5 do. Has anyone else noticed this?
At this latitude, I'm almost never able to take data during a daylight
pass, but noticed the same effect. The panel in question is th
"-Z", the parameter is number 41 (-Z panel output, Amps). The highest
value I saw was 0.01 (hex value 08). All of the other panels reported
anywhere from 0 to 0.3 amps, (varying during a pass).

Dave, if you only want to become a ham to effect the most efficient forms of transmission, you are on the wrong wavelength. Assuming you submitted and obtained a license, would your next target be those "inefficient" rag chewers, or perhaps Southerners, who seem to take a bit longer to say something than the rest of the country?

>draw your attention to the fact that no current organization or
>system uses morse for any kind of serious communication where it

False! There is an organization that awards those who have worked all 3066 US counties with cw. A sweeping generalization like that is refuted with one counterexample. I know they are "serious" about it!

But semantics, loaded words, and generalizations aside, what was said three thousand years ago is still true today:

"the rebellious dwell in a dry land." - Psalm 68:6

Code is a decrepit anachronism, but the old-timers insist it gets
through when nothing else will. Most packet development aims at high
speed. Perhaps there is a need for a low speed, but highly bomb-proof
digital mode for HF.

AMTOR is the closest there is at the moment, but this system requires
extreme frequency stability and accurate tuning. In addition, it is
still is no match for a skilled CW operator in bad propagation
conditions.

How about some suggestions for a digital mode suited to the real world
of HF? The main characteristic of this mode should be that it gets the
message through when the best CW operator gives up. Then maybe we can
bury code for ever!

    Sounds like me! I'm in the exact same situation.

>   Is there a purely software interface between my PC and
>   a modem that operates as a TNC, and if there is one,
>   where can I get it, and how many precious dollars is it?
>   Public Domain/Shareware is preferred of course (cheaper).

    Yes there is, I'm working on it now. Its essentially a
    PC version of the DIGICOM>64. I've been quiet now for several
    months, cause I didn't know if I was going to go through with
    the project. Now, it seems to be over the hill, and 0.8 is
    going out to the beta testers tomorrow.

    My setup uses a 202-type modem connected on the other end of
    your PC's parallel port. The software does everything you'd
    expect from a basic TNC: single connects, file upload, down-
    load, capture, etc. Nothing fancy yet, but several people have
    been using the system for several months as their sole packet
    system.

    I don't know if it will turn out as freely copyable/shareware
    yet......In a few more weeks I'll have more info.

     Can't tell you. My modem is built around a single chip TI TCM3105.
     Whole modem fits on a 2x3 card.

I have just started running NOS (0131), and it is fascinating
watching it build up the domain.txt file. I have, however,
encountered one perplexing problem, which is probably one of
my own ignorance.

Whenever I type in an invalid host name, my machine and the
nameserver just start chattering away with no end. I discovered
this the hard way when I accidentally mis-typed an address in
an smtp message. Is this a program flaw, or is this a mistake
on my part?

Example of problem:

  I type "ping wa9yvr.ampr.org" (an invalid hostname)

  My PC sends packet after packet to the nameserver, until I type
  "reset". Only then do I get a message that says "wa9yvr.ampr.org
   unknown."

Any ideas?   Thanks in advance.

        Prototype 905 MHz Digital Radio Update   2-6-90

  The first prototype 905 MHz "user" digital radio has been completed.
The intent of the prototype phase was to arrive at a reproducible design
using readily available components which could provide good performance
at low to moderate cost. These radios are intended to provide moderate
speed, 250 kbps-500 kbps user access to an amateur radio network.

  The prototype radio consists of four boards, PA, LO, RX and TX mounted
on a U shaped chassis. This modularity was done to facilitate design

but the pilot run design will be more integrated. Present effort is in laying out two PC boards, one for the PA and another containing the entire low power radio, power and control circuits. It apprears to all fit in a 5 by 7 inch enclosure on which the top is entirely heatsink. Interface to the radio is differential ECL; TXD, RXD, RTS and DCD plus S meter output, antenna connector and 12 VDC @ .3A on receive and under 4A on transmit.

An attempt was made to produce local oscillator signals of good signal purity and stability. This was thought to be important since similar radios will probably be used, in the near term anyway, at backbone IP switch sites and will need to operate in congested RF environments. There has also been some thought given to full duplex operation of this hardware but such operation isn't being considered at this time. Dual outputs of +10 dBM at approximately 96 MHz and 764 MHz are provided for transmitter and receiver mixing. Both output frequencies are derived from a single crystal oscillator. Spurious signals are below -80 dBC.

Transmitter output power is in excess of +41 dBM (12 watts) with modulation related sidebands down at least 70 dB (at 250 kbaud, modulation index = 1.4) at the edges of a 2 MHz wide, 905 MHz centered channel and out of band spurious performance also over 70 dB down (this excludes second harmonic which is approximately -60 dBC). Suppresion of adjacent channel interference is achieved by control of deviation and an active filter ahead of the VCO tuning input. The VCO is presently free running at 45 MHz and doubly upconverted to 905 MHz. This provides 905 MHz output frequency stability and accuracy essentially the same as that of the 45 MHz VCO alone. This performance seems acceptable but alternative plans are being considered for providing complete crystal derived frequency accuracy along with fast transmit startup and .5 Mbaud sorts of modulation should this be necessary. The present architecture has the advantage of being easily adaptable to transverter operation by slight change of crystal frequency and substitution of a multimode HF transceiver for the 45 MHz VCO and receiver demodulator circuits.

The receiver has good BER down to at least -90 dBM or so. Turn around time is even better than expected. Since adding a little design effort to the switching circuits it is now possible to square wave modulate the RTS (ptt) line at rates of several kilohertz and generate a clean RF square wave at full power. In between these square wave 12 watt output pulses the receiver is able to demodulate a -90 dBm signal applied to the same antenna connector (30 dB power attenuator inserted to protect the signal generator). The receiver is fully alive less than 40 microseconds after the falling edge of RTS. It is truly a "packet radar" and calculations show that with a 8' TVRO dish antenna or similar, the radio should be able to copy its own packets reflecting from a 747 aircraft at 4 to 10 miles distance. Pressed into normal use the radio should easily be back on receive before the previously transmitted packet has reached a distant node.

The first pilot run is expected to be of 12 radios and will no doubt reveal some areas where change can improve performance and reduce cost. Some thought is being given to a "one-board" lower power radio which

might even plug into a PC slot. Such a radio might use phaselock of an on-channel FSKed VCO instead of the dual conversion approach to reduce cost.

   PC board design is presently in progress for the pilot run radios. It is anticipated that these first radios will initially be used for backbone/switch radios as well as for user access radios as a part of the prototype northern California moderate speed IP network now being constructed. Plans have not yet solidified for construction of additional radios but it is expected that the next design effort will be aimed at providing similar radios for the digital allocations at 1249, 1251 and 1298 MHz.

Pat,

My name resolver code will repeatedly query a name server until it either gets the answer it was looking for, or until the server returns an authoritative "it doesn't exist" message. Without more details it's hard to know what's going on. Try tracing the messages ("domain trace on") and see what you're getting in response.

One problem that has occasionally reared its ugly head is that people will edit /domain.txt with text editors that append ^Z characters (a holdover from CP/M days) to the end of the file. The text mode library read routines will treat this as an end-of-file marker, so that any entries appended to the file beyond this point won't be seen.

Hi,
I want to set up a pc running net at 56kbaud, what do I need?
I mean: what board for the pc? what tnc ? modem ? etc. etc.
What are the software settings to enable net to use the 56kb connection?

Thanks in advance for your help
Vincenzo.

Phil, is there any backoff on this querying pattern? Seems
to me this could get very expensive if it doesn't cool down
after a few non-answers.

Do you cache authoritative "it doesn't exist" messages ?

Yes, there is base-2 exponential backoff. Additionally, if you have more
than one server configured, the code will cycle around all the servers
before sending the request to the first server again.

>Do you cache authoritative "it doesn't exist" messages ?

Yes. They appear in the domain.txt file as A records with empty address
fields. As far as I know, my resolver is one of the very few that do cache
nonexistent names.

Hi -

I've a few questions for Phil, Phil, Devon, and anybody else who's listening, but I'm posting it all here, simply because I'd like to hear from as many people as possible about this.

The history of TCP/IP in Rochester (New York) is rather short: a year or two ago, a few guys (N1DPH was in the lead) attempted to set up some IP activity. Essentially, it seems that the three or so people who wanted this to "happen" talked to each other for a few days, and didn't inspire many others to get involve. The whole thing lost steam and (essentially) died.

Here is where I come in: TCP/IP is something that I believe in, and if it is not _the_ direction that packet radio should be moving in, I feel that it certainly is a step in the right direction. So, with a few friends at the RIT club, I am again pushing to put Upstate New York on an IP system.

I have encountered a lot of resistance, though: in fact, the point of this message is to ask others to tell me how they conquered this resistance in areas where IP seems to be working. Being a lost island in a sea of AX.25, it's not possible for me to 'see for myself' what's going on out there.

Essentially, the world seems to be asking me: "What's the point?" At an area packet group meeting tonite, one BBS sysop said to me, "The day TCP/IP comes online is the day I shut down." I asked why, answer: "I don't like the way TCP/IP handles mail." (See footnote below regarding this conversation: there's more to the story than this). I am unable to answer many of the criticism and questions, simply because Unix is in my blood; it is my education, and it is my drug, and my fascination in networking issues makes the question: "What good is TCP/IP?" something I find difficult to answer!!! (Maybe I'm too close to the issue? Maybe my response is too automatic? Maybe it really *IS* too broad a question to be answered in two minutes?)

The other problem is this: I am not convinced that an IP network can exist in a packet world where MOST of the users are offline most of the time...AX.25 has gotten many into the habit of being able to turn it on and off at will, without it affecting the state of the network. Setting up the first AX.25 "TheNet" backbone must not have been easy: I know that if I put up TCP/IP and my friend Jim, 3 miles away, puts up TCP/IP, that there is a good chance that we will talk to each other for a few months and the while issue will again become dead in the water.

Thoughts/comments are most welcome, either to this newsgroup or to me personally (to be honest, followups to the newsgroup are

probably most likely to get a response: the e-mail blizzard to me is
up to 100K/day).

    Sincerely,

                Christopher Piggott, A.R.S. N2JGW

** footnote:
    The BBS is a major BBS ... the sysop has problem with the
'wormhole' affect - that it is extremely easy for those of us on
Internet to set up TCP/IP wormholes that take mail from TCP/IP Packet
and stuff them through Internet. I know that Devon is interested
in this concept, and there is a local prospective TCP/IPer who wants
to do the same thing. There is a ***LOT*** of resistance to this,
somewhat to the point of hatred, of the concept of packet radio
taking on vehicles other than packet radio, PERIOD. Personally,
I have some serious reservations, but I don't rule out the concept:
it sounds quite interesting, in fact. I'd LOVE to be able to ftp
files from internet via some packet IP gateway, etc. (within, of
course, the guidelines of part 97). I don't see it as any
different than a voice repeater having a phone line remote link.
Many do NOT share this view.

Tim, I have a HK-21 TNC. I don't klnow if it is the smallest, But I sure
have enjoyed it. It has traveled with me thruout Alaska, Canada and
the US.
I did have trouble with QRM when using 145.01. It seems the Xtal was

emiting on a bad Freq. I talked with the Heath folk and they offered a solution. Put a small cap on the Xtal and move the offending Freq down a tad. That was a couple of years ago, Perhaps they are installing that mod on newer units.
I have found that the internal battery is good only for 3-4 Hrs. My solution is to take a 9volt battery and connect it thru the external battery jack. That won't charge the internal one, but it sure will allow a longer use with a quick easy power source.
Although I have not had need for it, I understand that it does not support KISS. Several packrad users have submitted notes suggesting that they are burning EPROMS to allow this.

I have liked the mailbox feature. Unlike the PK232, it stores its messages in non-volitale
non-volatile ram... It also allows SSID's for the MBX

Good Luck

Oh yes ... I forgot to mention ... the idea of transfering a binary image by packet came up ... the idea of BSQ'ing it (a form of UUENCODEing) and transfering it by ax.25 seemed preferable to these guys ... why is this? (I'm not knocking them ... these are a swell bunch, very helpful and generous, for the most part each one would go out of his way to help you if he could ... but I'm curious about how the rest of the net deals with these kinds of questions)

Chris

Subject: Need WA8DED ROM for TNC-2

Hello,
   I am trying to find the WA8DED code for the TNC-2. Yes, I have
written to TAPR, and sent in my money, but I need to make a ROM here in
a hurry to use with the WN6I/N6XL ARES/Data program for evaluation for
possible use in an upcoming ARES exercise (wish it used KISS). I'm in a
BIG rush! I have also tried other avenues, such as calling various Ham BBSs
around the country, and have even had a local ham correspond with DED himself.
(DED said to write to TAPR). We just don't seem to be well connected
"out here".
   I have a ROM burner, and what would be ideal would be if someone would
post for FTP the intel hex format file for the ROM, or for the Nord->Link
enhancement. I do need the TNC-2 version, not the TNC-1 version, as it is
difficult to power the TNC-1 from batteries, due to its internal supply and
requirements for both + and - voltages. Barring an FTP post, I would
be glad to call someone at my expense and transfer the file over the phone.
As far as I know, the 'DED code is public domain; just not all that
popular apparently!
    Thanks. Bryan N9GBJ

Chris,

  I think there are many reasons that you are meeting resistance and you are not alone. Every ham through out the history of hamradio has met the the same kind of resistance. The first cw ops (as apposed to spark, the first am, the first ssb, the first fm...) have had this problem. It must have to due with some inherent stubburn streek that most hams have. This must be so, as it takes a good deal of pig-headedness to master cw.

 Also there is I think an ego thing involved here. People (and especially hams) do not like to be shown that tey may be wrong. It also has to due due with a lack of understanding of what is realy going on and maybe a refusal to admit that they do not understand. And also ecconomic factor involved, but I think to a lesser extent as the same hams who refuse to upgrade from there coco or vic 20 will however shell out mega-bucks for a new tower, hardline and the latest from icom tentech etc.

 So keep plugging away. Progress will come eventually, however slowly.
 I myself am going to give a talk on tcp/ip at our local packet group meeting this month.

Well, here in Switzerland, TCP/IP is really only a few months old.
The packet radio situation here is rather primitive. We have an
AX.25 based mail forwarding net which connects the major cities in
Switzerland with Italy to the South, France and Germany to the North,
and via Germany with Austria to the east. This is coupled to the
worldwide net, so we can send and receive to the rest of the world.

The TCP/IP situation is growing, but not nearly so complete. Most of
the action seems to be in Germany, where a fairly extensive TCP/IP
net has grown up, in part because of a group at HP Europe which has
set up several TCP/IP nodes, (the two biggest are in Stuttgart, DB0ID,
and in Buelblingen, (don't know the call), which is the European
manufacturing center for HP. We don't as yet have a direct link with
these guys, so our TCP/IP net (which is really about 10 of us here in
Basel), doesn't go anywhere yet. Most of us who use TCP here also do
so professionally, by the way, so we're probably not typical of the
amateur radio people there.

We haven't had a great difficulty getting cooperation of other sites,
who are most happy to route TCP packets via the conventional AX.25
digipeaters. Actually a big problem for TCP that might eventually come
up here is the fact that TCP packets are *LONG*, particularly during
an FTP. At the moment, when FTPing we try to do so directly, and on
a relatively unused frequency for this reason. (This is worse because
the highest speed modem in use over here is 2400 baud), and most people
(>95% are still on 1200 baud).

As for connecting with the internet, that's forbidden by the PTT (the
equivalent of the FCC for Switzerland). The system may *NOT* be

interconnected in Switzerland. So this issue just doesn't arise.
By the way, one of the reasons people are interested in TCP here is
for file and mail transferring.

Not sure if this helps, but that's our situation.
                                                -jcp-

     First of all, my thanks to Bob N4HY and others for posting the
telemetry decoding information. It is really appreciated, and again I

regret, a somewhat hot-headed posted request for information earlier (yes, Phill, I am a member of AMSAT). So thanks to all, and a job well done.

I would like to suggest something here though. Change is part of life, and particularly necessary in view of the short developement/ implementation time that you folks have had to deal with. I run into changes with software packages professionally, so I have had a bit of experience with this problem.

I would like to suggest that somewhere, in one or more of ur telemetry frames that you indicate a "TELEMETRY VERSION NUMBER". I think at present, there is little difficulty distinguishing between the 2 versions (I think) in software. However, in the future, its going to get real messy for software developers without a version stamp. This will make it easier for software, later when (or if) u decide to collect early telemetry from around the world, and try to decode it all. With a version number, the software can switch to the appropriate formats and formulas.

Perhaps the way to do this is to add a fake telemetry channel with its value indicating a version? How abt FF:03 for version 3? Or perhaps an additional status byte? Just some ideas.

Keep up the good work, and tnx again for sharing the information on the telemetry.

Here in sunny WDW land (central fla) tcp/ip is restricked to me and one other person. The local packeters have mostly c64 or similar micros

and have no desire or cannot afford to upgrade to a micro that can run tcp/ip.

  Those other hams that have msdos or mac type micros are not interested in packet since most packet use is on two meters. These people have long since abandoned two meters and have their on reteaters on 70 cm. They are mostly those that work at the cape, or for marten marrieta or some similar place. I my self will probably migrate up to 70 cm to do packet tcp/ip also as will the other tcp/ip person. Sigh.....

This is not an easy thing to do. Some of my friends here on campus decided to attend one of the local meetings and we were asked many questions similar to what you were asked. Now, all of these friends were Unix geeks; people that live and breathe TCP. We know it's better. But how do you explain this to someone that's never tasted it? We couldn't. It's like telling a blind man what sight is like. It's very difficult to do. I usually show them demos of multiple ftp sessions and things like that. It also helps to have a link to the local university ethernet (which I am fortunate enough to have running). I show them things like my callsign server and such. If they are programmers, you might be able to hook them in with a description of how simple (and standard) sockets are to work with.

One of the big problems is that they're so used to only using the network for exchanging mail and messages that they can't see the advantage of actually being able to log in and share cpu time. As soon as there's some interest in the area, I plan to offer accounts to any local ham on my Sun. There's a lot of fire-power here that's not being used when I leave work at night (or rather, in the morning 8-). Might as well get used. And then there's the concept of sharing disks, sharing processes, and what about X windows? But it's all so different, they can't grasp the possibilities.

> Being a lost island in a sea of AX.25, it's not possible for me to 'see
> for myself' what's going on out there.

That's when I log in via modem and show them Internet demos. Then I say "all we need is a little effort and funding and we can have this via radio." I've found that just typing "telnet berkeley.edu" gets some interest after the login prompt for a system on the other coast pops up. And it looks just like the prompt I got when I dialed in!

>   The BBS is a major BBS ... the sysop has problem with the
> 'wormhole' affect - that it is extremely easy for those of us on

> and stuff them through Internet.

I would imagine that his reasons for this are closer to being selfish than based in actual reason. My guess is he doesn't want things done better unless he can do them himself. If there are real reasons, I'd like to hear them.

Yesterday the ARRL put out bulletin 7 (2/8/90) dealing with the
FCC proposal for the codeless license. Amazingly, they want
to DISCONTINUE the Novice license in favor of the new codeless
license!

Dave Sumner of the ARRL sent me the text of the FCC release.

73,
Tad Cook

Dear Tad:

Since you have MCI capability, perhaps the best way to address your

question is to send you the full text of the FCC news release. (The

actual Notice of Proposed Rulemaking is not yet available.)

Everyone should bear in mind that this is an FCC PROPOSAL only.

73,

Dave K1ZZ

Report No. DC- ACTION IN DOCKET CASE February 8, 1990

FCC PROPOSES NEW CODELESS CLASS OF AMATEUR OPERATOR LICENSE

(PR DOCKET 90-55)

The Commission is proposing to amend its rules by establishing a codeless class of amateur operator license to be called the Communicator Class. The Communicator Class would be incorporated into a simplified licensing structure containing four ascending steps: 1) Communicator 2) General, 3) Advanced, and 4) Amateur Extra Classes. Current Technician and Novice Class operator licenses would be grandfathered indefinitely, with no new licenses issued for those license classes but existing licenses could be modified or renewed.

The codeless operator class license would satisfy three major objectives. The first objective is to offer an entry level license for all persons who find telegraphy a barrier to pursuing the purpose of the amateur service. The second objective is to design a codeless license that can easily be implemented into the current licensing process. The third objective is to avoid any negative effect upon current licensees, the volunteer examiners who administer amateur

examinations, or the Commission's workload.

The amateur service exists for the purpose of self-training, inter-communication and investigations to be carried out by duly authorized persons interested in radio technique solely with a personal aim, and without financial gain. Individuals seeking a license to operate an amateur station must prove that they can send correctly by hand and receive correctly by ear, text in Morse code signals. Although this requirement may be waived for an operator of an amateur station transmitting only on frequencies above 30 MHz, each of the five classes of operator licenses issued by the Commission requires the applicant to pass an examination in the international Morse code.

The Communicator Class operator license would not require knowledge of Morse code telegraphy messages. Privileges for the Communicator Class would include all emission types. The Communicator Class license would replace two existing beginner operator classes and would simplify the amateur operator license structure.

The Commission would require applicants for the Communicator Class license to pass a 60 question written examination. The new question pool would be comprised of the questions from the two pools currently used in the Novice and Technician license examinations as well as the addition of new questions.

The proposed transmitter power for the Communicator Class would be 200

watts peak envelope power and the licensee's station would be eligible for a Group D call sign. Stations with Communicator Class control operators would not be permitted to transmit on the 2 and 6 meter VHF bands and the HF bands. The Commission is requesting comments on the effect of excluding Communicator Class licensees from the two VHF bands. Comments are also requested on the desirability of including the opportunity for Communicator Class licensees to experience on-the-air telegraphy operation on the HF bands. Additionally, a Communicator Class licensee who passes or receives credit for a telegraphy examination would be authorized the privileges of the Technician Class.

The Commission is requesting comments on all aspects of this proposal.

Action by the Commission February 8, 1990, by Notice of Proposed Rulemaking (FCC 90-55). Commissioners

We computer people sometimes act like ASCII was carved in stone and brought down from Mount Sinai by Moses. There are in fact other binary codes that work just as well or better for certain purposes. Morse code is such a binary code. Two computers can communicate using Morse over a pice of wire (baseband signaling) just as easily and with the same bit error rate as any other binary code. Bits are bits even if you call them dots.

Part of the problem is that what we call CW in the amateur radio world is really two entirely independant things: a binary code called Morse and a modulation technique called on-off keying. The binary code called Morse is more efficient than ASCII for general English language text. That's what it was designed for. Consider the text sample

THE QUICK BROWN FOX JUMPED OVER THE LAZY DOG

By my count this is 44 characters and 413 dots, using 3 dot times between letters and 7 between words. Using 10 bit ASCII async TTY format, it would be 440 bits. This particular sample puts Morse at a disadvantage, since it includes a higher than normal concentration of long letters like Q and J. Longer texts are even more efficiently coded in Morse. CW operators also use an extensive suite of standardized prosigns and abbreviations to compress their text even further.

On the other hand, long streams of numbers would be far more efficiently coded in ASCII. ASCII also provides upper and lower case letters, more punctuation, and a parity bit (which most people don't use.) None of these features are required for transferring English

text.

Using packet instead of asynchronous TTY format eliminates the start and stop bits of each ASCII character but I would hazard that the total overhead of preamble, headers, bit stuffing, and flags would be at least as much for most text packets.

I never operate CW any more and don't even own a key. But I couldn't resist setting the record straight about Morse being an inefficient code. For general purpose coding of English language text, it is more efficient than any of the current computer character sets.

So far so good.

>Morse code is such a binary code.

International Morse Code is a terniary code. It has three elements: dot, dash and space. You can, of course, represent it (or any information, for that matter) in a binary code, but at the expense of additional bits.

> Two computers can communicate using
>Morse over a pice of wire (baseband signaling) just as easily and with

The character code one uses has nothing to do with the bit error rate of the channel. In ISOspeak, the character code is a level 6 (presentation) entity; bit error rate is a property of layer 1, the physical layer.

>   Part of the problem is that what we call CW in the amateur radio

>Morse and a modulation technique called on-off keying.

Quite correct, except for Morse really being a terniary code. Much of the reason "what we call CW" is so inefficient in use of power and spectrum has to do with the modulation method. But the character code itself is also inefficient, as we will see...

>The binary code

This is a flawed analysis, as you almost admit. If you want to compare apples to apples you should not compare Morse with ASCII. Compare Morse with Baudot, a 5-bit code. Neither has the lower case letters that you consider unnecessary for transferring English text, despite the fact that most of your posting was in lower case. With a more level playing field, Morse rapidly loses ground.

And if you discount the "dumb terminal" mode of operation, i.e., if you allow your computer to do more than emulate a 50-year-old Model 15, you can do even better with modern computer-based coding methods. For example, file compression programs for PCs and Macs are now extremely widespread, and they routinely yield bit savings of 60% or more on typical ASCII-encoded English text. These algorithms adapt automatically to the characteristics of the input text in ways that no human operator, using Q-codes and abbreviations, ever could.

>   Using packet instead of asynchronous TTY format eliminates the
>start and stop bits of each ASCII character but I would hazard that the

Once again let's level the playing field. Those overhead factors should also be added to your CW message; it should begin with something like KA9Q KA9Q KA9Q DE N7AHL N7AHL N7AHL R R R FB PHIL -- before continuing with the "quick fox" message. The overhead in an AX.25 packet provides the functions of this header and more -- there being no CRC in most CW-encoded messages that I've copied.

> But I
>couldn't resist setting the record straight about Morse being an
>inefficient code. For general purpose coding of English language text,
>it is more efficient than any of the current computer character sets.

I believe I have refuted this when a fair comparison is made and modern, readily available computer encoding techniques are used. The *only* advantage Morse code has EVER had is that it can be sent and received with very simple equipment. Modern technology has steadily reduced this advantage virtually to zero in most situations.

By the way, it is possible with the Microsat satellites to demonstrate what digital communications can REALLY do when you design it right. Three of the four satellites transmit PSK packets on 70cm. Even though I know the theory behind PSK and why it is so much better than AFSK/FM (the de-facto packet radio standard) I still find it exciting to see perfect packets being recovered from a signal that has all but faded into the mud (using a SSB receiver) just before the satellite sets. In less than a second, I can retrieve a hundred error-free bytes from a signal that I'd be lucky to copy a few characters from correctly if it were CW. And even here there's room for improvement (FEC) if we chose to implement it.

Phil

I was advised that this news group would be able to offer some
help or advice with regard to Phil Karn's KA9Q package and
possibly with making a PC-based Novell network talk to a Unix
based tcp/ip network.

I would appreciate it if anyone would MAIL me any advice, or
information, or suggestions, etc. about how all that would
fit together.

Some questions that I will eventually have to get answers to:
  - what is KA9Q?
  - what goes where on the PC network?
  - how much of my precious 640K gets chewed up by it?
  - does it sit in the server?
  - do all PC that want to be able to see the tcp/ip machines
    have to be running the software?
  - how transparent is the access (e.g. Novell makes files on
    the server look like just another disk volume, does the
    same thing happen with the Unix network)?
  - can a PC access the Novell and tcp/ip networks without
    having to switch out one set of drivers and install the
    other (i.e. 'simultaneous' access to both)?

Thank you for your help. Mail to either of the following addresses
should reach me without difficulty.

AMSAT Journal? With AMSAT membership or is this my wishful
thinking? If ur supposed to get it with membership, I havn't been.
All I've got since last May (I think) was abt 3 4-page newsletters.

Who should I contact if members ARE supposed to get the
journal? What have I been missing all this time :-(?

>Well folks, "the times, the are a changin'"! With a $100 2m FM rig, a
>$50 TNC, and the terminal / computer of your choice, you can copy the
>telemetry and bulletins from the DOVE Microsat. Really! Just take your
>packet station, and put it on 145.825 MHz.

I guess I just wasn't paying attention before the launch, because I
hadn't realized that DOVE could be copied with a standard TNC. Paul
is right--just dial up the frequency and wait. (If you don't want to
wait 24 hours or run orbital elements, try 10 p.m. and 11 a.m. +/- 2 hrs.
as one of the AMSAT folks suggested.)

And to echo Terry Bell's comments in r.h-r.packet, the KA9Q TCP/IP
software works great for this. I think a lot of people believe that
Phil's package is only for TCP/IP. Not so! It's also a full-blown
AX.25 package. I use it for everything. Anyway, the last pass of
DOVE is still sitting on my Mac's screen; next pass should be in a
little while. Just waitin' for the little puppy to come over the horizon...

Like Paul says--try it!!

73,
Patty

p.s. I followed up in rec.ham-radio because I suspect that some people
who don't read .packet might get more interested in the subject after
Paul's posting. But I'm recommending extended followups to r.h-r.p.

As far as I know, all protocoles currently in use only allow callsign
no longer than 2x3. My official callsign here is W1/EA2SN. As I want
to follow the law (and keep FCC happy ;-)), I am including at the
end of my QSO: "This is W1/EA2SN in Amherst, MA, using PR ID EA2SN".
In the next "step" there will place for longer callsigns? I read
something about this, but I don't remember when or where.
Please email comments to iza@ecs.umass.edu or iza@umaecs.bitnet
and I will post back your comments. TNX. Jon, W1/EA2SN

I for one do not understand why those who want to experiment with
modern digital communication are forced to learn an archaic and
inefficient coding method in order to use radio to send data.
IMHO, the ARRL would benefit a lot by making it easier for
computer hobbyists to fool around with radio links.

The Hamtronics transmitting converter is working quite well; the signal
is clean and strong on the output. It does not exhibit any tendency to
spray spurs around during keyup or dropoff, and the spectrum looks quite
nice to at least 60db down, which is the best my instruments will
measure.

I get two watts out of it continuously for a couple of hours when driven
by the DSY modem board. It gets a bit warm, but not so that you can't
keep your finger on the output transistor.

I suspect that I'd not bother to put a bigger heatsink on the output
transistor even on a mountaintop (thinner air means less cooling, you
know).

I haven't had a chance to measure the receiving converter because I'm
having problems with the squelch in the modem itself, but some initial
tests indicate that you really need some sort of selectivity in front of
the RX converter - and probably some gain. One of those helical resonator
preamps would probably be just the trick. Without one, I get lots of
images from business radios and such.

Not only that, but the final do all, end all, command, talk to it, track
it, who's it, what's it code for the Microsats that I doing here will
run as a task in Phil's code. The code is getting sufficiently complex
and with so much stuff in it that more than PC at 4.77 is needed to
get good service out of it but for this stuff it is perfect. I use
to upload/download from BBS's, check into them, ftp code to clark at
TOMCAT or to Phil or whatever. We are even thinking of using it in
an internal network for AMSAT to get us off of GTE Telenet.

Bob

OK, OK. You people have inspired me. I want to see if i can grab the DOVE's
signals. Do I HAVE to have a special antenna, or will any ol' outdoor thing
work? (I have a "coathanger special" vertical thingy, with the radials and
the whole bit..) So, once I tune up, wait for telemetry, and get gobs and
gobs of packet satellite wonderfulness, what does it all mean? I have seen
the telemetry, and it is obviously encoded or something. How does one decode it?
WHAT is is talking about, generally?
Thanks in advance for your help...

What is the latest version of the KA9Q net or nos software, a version
modified to run on the Macintosh computer and from what system can a FTP
a copy of it.
Thanks,

I've been hearing about running the TCP/IP code on a IBM PC for a while,
but not having
access to one I just didn't pay that much attention. Now I have access
to a 386 Clone and
would like to see if it is possible to do something with my PK-232

TCP/IP style. What is a
good route for getting up and running.

I don't have an external modem so I'm limited to 1200 baud, but I can
operate on 144, 220,
or 450. Is NOS the latest version of the complete package or a subset?

Thanks,
Mark

The NOS software is currently being actively worked on. SM0RGV is adding
a very nice mailbox facility with cross-protocol linking capabilities
and others are wringing out the bugs. I'm also begun updating the user
reference manual (the concise summary of commands and what they do) and
N3EUA is working on the tutorial.

So the short answer is that it's all in a state of flux, but you're
welcome to peek over our shoulders as long as you promise not to ask a
lot of questions that will be resolved either by new releases or the
update of the update of the manual.

Current snapshots of the code are available by anonymous FTP from
flash.bellcore.com. Look for /pub/ka9q/src.arc (sources) and net.exe
(executable).

As far as Mac software goes, I have no direct involvement. WA8DZP in the
Bay Area is the guy doing all the work, and N6OYU and N6BIS are the
contact people for this. The latter two are on the net as thom@apple.com
and winter@apple.com, respectively.

Phil

Thought people might like to see this. I really wanted to send this
more directly to the software people involved in the satellite program,
but didn't have their addresses...

-jcp-

DOVE Satellite Telemetry 20:41 GMT pass over Europe

Downlinkd by HB9NBB@HB9AC (Joseph C. Pistritto) in Basel, Switzerland
with Kenwood TR7850 2m FM, Heathkit HD4040 TNC-1 clone with KISS,
NETPC by KA9Q, 4db gain 2element Beam antenna (handheld & pointed).

Times on 'vhf recv' lines are Middle Europe Time (GMT + 1 hr.)

Note: The time on board the satellite seems to be about a minute
slow. I missed a couple of frames in here, as I was hand holding
the antenna!

/ col:rec.ham-radio.packet / karn@ka9q.bellcore.com (Phil Karn) / 3:53 am Jan 25, 1990 /

As a fellow AMSAT board member, I feel I ought to add some comments of my
own to those of N4HY.

It shouldn't be a surprise that since the launch, people like Bob and myself
have been deluged with requests for information about the Microsats. I
usually respond along these lines:

"Join AMSAT. All the basic information you want is already being distributed
on a regular basis to AMSAT members via the Amateur Satellite Report
(newsletter) and in the AMSAT Journal (containing more detailed technical
articles). It's really not that expensive, and you'll also help support the

organization that put up the satellites. Write to AMSAT, PO Box 27, Washington DC 20044, or call 301-589-6062."

This appears to offend some people, who seem to think that AMSAT is out to "sell information" to "make money".

Nothing could be further from the truth. First of all, AMSAT is a 501(c)(3) corporation. That means "nonprofit". NOBODY gets rich from "working" for AMSAT -- but you can, and often do, become poor! As a Director, I receive regular monthly statements about the financial health of the organization, and I can tell you that this year it has been mostly red ink. Satellite launch years are always a heavy drain on the organization's reserves.

It shouldn't be hard to understand why. Although almost all of the actual work is done by volunteers and we hit up corporations for donations of surplus space-rated parts whenever possible, there are some things you just can't get for free. Airline tickets to French Guiana, among many other things. Not to mention our launches, which are now starting to cost us more than token amounts of money. Sure, we could stop launching satellites, but then why should we continue to exist?

As amateurs, we are forbidden from charging for the use of our satellites. And I doubt we would even if we were allowed to -- unlike some repeater autopatch groups I know. We prefer to raise money through voluntary donations. But the Tragedy of the Commons is ever-present. It's just like public TV or shareware software; without a quid-pro-quo relationship between being a member and getting the service, you'll always have a lot of users who don't support the organization. (Some would use the term "freeloaders", but I'm trying to be polite.)

So we've had to emulate public TV by offering something tangible in exchange for membership. Public TV stations give their members monthly program guides; we give ours newsletters. We also sell copies of satellite tracking software. Yes, we're well aware that newsletters can be photocopied and disks can be duplicated, just as satellites can be used by non-members. But that hasn't kept us from selling enough copies of N4HY's Quiktrak to make the difference between being here now and folding up for lack of funds years ago. So apparently there are SOME people out there who think it worth giving something to AMSAT for the enjoyment they get out of amateur satellites even though they're not forced to do so.

There's an even more basic reason for responding to requests for information by saying "Join AMSAT!" It's very simple: the information you want already exists, and it is much easier for us (and you) to get it through the usual channels than it is for us to have to answer the same questions over and over on the net. Those of you who have ever worked as programming consultants (or have used their services) are undoubtedly familiar with the term "RTFM!"; this is really the very same situation. Consultants don't mind answering questions as long as they feel the person really needs their help.

Bob is one of a half dozen or so people who have completely committed themselves to the Microsat project for the past two years. I'm not one of them; my own commitment to amateur TCP/IP has been more than a full-time

activity for over four years now, so I've not personally been able to give much more than moral support to the Microsat project. (I do understand it's flying my AX.25 code.) Nevertheless, I have been close enough to the project to see the incredibly intense dedication of each of these guys, and the constant personal and financial sacrifices they make.

It is certainly not the lure of money that motivates these guys; if any revenues accrue from AMSAT's licensing agreement with Interferometrics, 100% will go back to AMSAT to fund future satellite projects. No, they are doing it because they really feel they're creating something radically new and useful for the amateur service and for the world. Perhaps it is a little unfair for them to expect everyone else to share their same level of dedication. But it is much more unfair for the amateur world to ascribe selfish motives to them, or to expect them to bend over backwards just so they can "save" someone the cost of an AMSAT membership.

To close on a somewhat lighter note, I would like to point out that I earlier used the words "committed" and "commitment" rather than "involved" and "involvement". This was deliberate. As WA3ZIA (one of those "committed" to the Microsat project) is fond of pointing out, the difference between being "involved" and being "committed" can be seen in your morning breakfast of eggs and ham. The hen was "involved" while the pig was "committed". :-)

73,

Phil

>a "PSK" modem for my TNC-2 clone?

There are three options that I know about. First, a company called Radiokit sells kits of the G3RUH PSK modem design. Second, TAPR sells a kit of the W3IWI PSK modem design. Third, Paccomm in Florida reported recently that they

have (or will soon have) an assembled and tested PSK modem unit.

I have personal experience with the W3IWI design from TAPR. It went together fairly easily (though it's not a good unit for your *first* kit assembly, as the PCB is fairly tight, with things like resistors standing on end... not at all difficult if you've got some kit building experience, though), and tuned up quickly and easily with the aid of the PSK cassette from AMSAT.

The only contact info I have readily at hand is for TAPR. The two commercial vendors advertise regularly in the ham rags though, so you shouldn't have too much trouble finding them.

Kevin,

Geeze, I just tweaked a junky FM rig to a discone and TAPR and presto -
the telemetry came pounding in followed shortly by a genie asking for
donations.

The AMSAT Journal is a new publication. Have been three issues so far.
It's quarterly. Most recent issue is Nov '89, and contains proceedings

of the 1989 AMSAT Space Symposium. AMSAT Journal comes with membership,
so seems like you should have rcvd 'em.

There was also publication called "AMSAT-NA Technical Journal" which did cost
extra, but that is now defunct. Only two issues were ever published of it.
It's contents were "more technical", so probably of interest to a smaller
audience. The two issues that were published, however, were GREAT! and
i recommend buying them, even tho they do cost $10 each.

The person you should contact to solve all problems is Martha at the AMSAT
office, 301-589-6062.

Bdale asks: Has anyone in your area tried Hamtronics converters?

Nope! After years of trying to get the K9NG 9600 baud modems going using
Hamtronics 220Mhz FM transceivers (FM-5?) we decided to steer clear and
use off the shelf RF decks. We do have one local who is considering
a split band xverter with a 220Mhz output and a 70cm input. I gave him
a copy of a 2 part construction article that appeared in 73 mag which
detailed the 220Mhz half. He may turn up a design before the end of the
year..
Brian Kantor (WB6CYT?) our fearless list maintainer and ampr.org czar is
using the Hamtronics converters. Any comments Brian?
One thing is for sure from our experiments, the dcd is very fussy.
I have been getting dcd falsing about 50%+ of the time. This I'm sure will
be easy to clear up with a band pass cavity or preamp with helical filters.
We looked high and low at Dayton last year and the number of receive/xmit
converters we saw was very low. Maybe TAPR should consider doing them,
after the pRadio of course.

Not that I know of, but I am working on such a driver for SunOS now. It
will send IP direct from the kernel wrapped in AX.25 and KISS out the tty
lines on the back. Once working, a port will then be made to run under
BSD Unix. I don't expect to have this done for a few more months, though.

I've been interested in ham radio for about 4 years, now. I actually considered getting my license about three years ago, but got started on the code requirement and never finished. Does that mean I am unwilling to dedicate sufficient time to ham radio? Maybe. Does it mean that I have nothing to contribute to ham radio? I don't think so (although some obviously do).

I have looked into several areas of amateur operation, including QRP, EME, satellite, and packet. The only one which holds enough interest for me is packet (altho satellite is tempting too), and of course code is not really needed for digital operation.

What this really boils down to, for me, is that I have many other things to do with my time, and I don't want to dedicate a huge piece of it to ham radio. In fact, I might end up discovering that I don't like it at all. On the other hand, it could become a real devotion. But I'll not try it at all until I have a ton of time on my hands (and I have 43 years to retirement) or until the time necessary can fit into my schedule. If you don't want hams who cannot (or will not) dedicate their lives to the hobby, I'm not your man. If you're willing to accept people who are only interested enough to sink five or six hours a week and a few hundred bucks into yet another hobby (and I have a few already), give me a call when a digital license (or no-code, or whatever you call it) is available.

Flames and comments to me, unless they're of general interest, please.

Bill.

Does anyone have any info on using KA9Q's TCP/IP package with the
MFJ-1278 (running MFJ's latest EPROM)?

I've been down for a couple of months now and would so much like to get back
on the air, but it seems, last I checked, MFJ's EPROM (release 2.3, I think)
is NOT compatible with 4/88 (or is that 4/89) version of NET.

An alternative question: Are there any files which describe getting NOS
up and running? I'd put it up but I don't know a thing about it, except
that it doesn't use autoexec.net and hosts.net configured in the same way
as for NET.

Thanks in advance, Joseph Skoler, KC2YU, skohc@cunyvm, 44.68.0.56 (soon!)

Dear netters, om's, yl's, xyl's

is there any documentaion available for the KA9Q et al. package, wich is
available from info-server@unido ??
I'll try to put it on some Siemens *IX machine.
Perhaps, out there is a newer release than 871225.33q ?
I would be glad to hear something from outside, 'cause nobody seems
to use this software in the munich area.

I am in favor of a satellite/space ham radio newsgroup! Yeah!
At out site, there is no access to news feeds... So if it were in the worm
(oops, form) of a digest or list that would be great!

Also, I asked the question once before, and I'll do it again... I have been
monitering the telemetry from the DOVE sat. for several days. How is the
telemetry decoded? (I assume it means SOMETHING)...

Thanks!

Yeah, if you can't work 100 countries on all 5 ham bands in CW every
year, including every CW contest, as well as handling lots and lots of
emergency and other traffic in CW every day, then what good are you?
If you haven't operated CW mobile while driving the expressways around
your city, then you haven't experienced real ecstacy yet and are just
the lowest of the low. :-)

And if you don't use a straight key you aren't a real ham anyway :-)

Code *IS* digital

> What this really boils down to, for me, is that I have many other

It's not a flame since I'm just kidding (except the part about code
being digital).

    I have since spoken to Harold and he told me the following:
His program TLMPROG.ARC is of limited application, but does do
the job. It is available in the public domain - all AMSAT
donations for use appreciated though.

    Bob McGyer has written a bigger and better prog that requires a
KISS TNC. This program is going to be adapted by another and soon
released by AMSAT as an all singing, all dancing telemetry
program. Contact AMSAT for details.

    AMSAT have lots of satellite related software, good stuff to
make satellites more fun. Contact AMSAT for details:

I would like to propose the following amendment to Part 90 and am interested in comments from potentially affected parties:

To amend Part 90 creating a new "Emergency Medical Radio Service". This service would differ from the current "Special Emergency Radio Service", in which most ambulance services are licensed now, in that it would be an exclusive allocation for use only by those organizations whose primary mission is providing emergency care and transportation of the sick and injured.

At the present time, spectrum for new users is scarce in populated areas. Existing channels are shared with school buses (ever hear the CB-like chatter from them?), veterinarians, hospital security departments (some use up enough air time for a small police department), ski patrols and even handicapped individuals (why?).

While many Public Safety agencies are making or planning moves to newly opened 800 MHz spectrum, in many areas such a move is not desirable. Existing communication systems and area bandplans can make it preferable to stay on VHF-High Band or UHF. Moving some incompatible services to 800 MHz would just transplant an existing interoperability problem to a new frequency range.

Since it appears that some spectrum is being deallocated from the Federal Government's exclusive use, I propose using some of it for this "new" service. While it was not technically feasible in years past, new radio equipment has sufficient bandwidth to use new frequencies in the 138 to 144 MHz or 162 to 174 MHz bands as well as existing EMS channels in the 155 MHz band.

I would be very interested in comments and suggestions from other persons in the EMS field that might be affected by this idea. I am also interested in informed comments from FCC-type people on how likely a Rulemaking Petition would be to have any success.

Does anyone have any references to magazine articles or other information
on decodeing the DOVE telemetry data. I receive it very well at my QTH and
would like to keep track of what going on.

I will post 1000 lines of code here to do all the microsat telemetry
decoding (and you can see my horrid source code) and/or the telemetry
decoding equations. KISS IS REQUIRED, as it captures the frames live.
You can replay them later as it has a file dumping procedure. It
dumps both RAW kiss packets for later decode and .ASC file for your
perusal. This way you get to see all the packets by eye unless you
know how to read raw kiss packets and decode hex by eye ;-). Let me
know folks preference. We can put up the stuff for anonymous ftp as
well on tomcat. What say?

IMHO, you are correct.  This is the reason AMSAT and TAPR pushed on
the ARRl last year to do same.  They put together a study committee
and it recommended a NOCODE license.  The ARRL has a request for rule
making before the FCC right now to institute a NOCODE license.

PACSAT DOVE and LUSAT CW decoding software is available from AMSAT
via me, Joe Holman KA7LDN.

I've written software to decode LUSAT's CW beacon; and, i will be
performing additional work to N4HY's PACSAT decoding software
for the PACSATs (including DOVE).

To get the stuff:

- Send a SASE 5 1/4 diskette mailer to:

  Joe Holman, KA7LDN
  22909 NE 24th Pl.
  Redmond, WA 98053

- or, send a $5 check donation (or more!) to AMSAT
  at the above address, to cover diskette
  and mailer if you can't provide...

Hello,

   I would like to receive The Packet...John Augustine
                                       McDonnell Douglas
                                       Dept. C636
                                       Bldg. K34-1w
                                       5701 Katella Ave.
                                       Cypress, CA 90630

                                also, Harrison Spain
                                       McDonnell Douglas
                                       Dept. C649
                                       Bldg. k34-5w
                                       5701 Katella Ave.
                                       Cypress, CA 90630

  I would like to know more about how the Multiple Phase IV DECnets will be

able to interoperate with cisco's upcoming DECnet Address Translating Gateway (ATG). We are looking forward to using ATG here at McDonnell Douglas. Will I be able to use the existing ags-2 chassis and future hybridge-d chassis that I will be putting in place very soon?

regards,
John

p.s.

I would like someone to pass on to management how we appreciated the excellent support Joel Bion gave us sometime back, when we were having file transfer problems using decnet. You have an excellent product, and its individuals like Joel that really make you feel that you're glad you went with Cisco. THANKS JOELLLLLLLLL!!!!!

regards,
John

Harold Price, NK6K has written a program to decode the software. It is called TLMPROG.ARC if you want a copy in a hurry, it is available from the WB6YMH BBS in Drive A0. You can dial up: (213) 541-2503. You can connect via packet (145.36) and download via PMODEM.

I have heard that Bob McGyer (sp?) has also written a decoding program. But a call to Martha at AMSAT should provide answers, and software.

I suggest that if you download Harold's program and use it, a donation to the AMSAT coffers should be considered.

Are you kidding? You can copy that thing on the proverbial wet noodle :-)

I had the 470 turned on and scanning VHF in "wraparound" mode last Sunday. Strangely enough, around 145.825 it locked onto a carrier with something that sounded awfully digital. I think to myself, that rotten Alexander guy has run out and bought a TNC (him being all PO'd that I scooped the dual bander on him :-)

Turns out he did no such thing. Yes kids, you too can copy DOVE using an FT-470 and a duck. And I'm talking LOUD! Congrat's are definately in order for everyone who worked on the Microsats!

Well, being one who's trying to make the K3MC awesome I/O a reality
SOON, I like to point out a design trade-off we're looking into.

rather than a $50 LCD display in the standalone version, it been
suggested we use a blinking red LED to indicate a failure.
Of course, the LED pounds out morse code :-).

Sorry I'm so cynical this week guys.

I can agree from sad personal experience that the Hamtronics FM-5 220 MHz radio is a piece of junk. The main problems are a complete lack of interstage shielding, and no PC board ground plane (it's completely bare of foil on top). You have no *real* concept of how bad this thing is until you try to tune up the transmitter into a spectrum analyzer. Believe me, I've been there. I wasted good money on TWO of these units some years back.

If you are unfortunate enough to have one of these turkeys, *please*, for the sake of your fellow ham, don't use to transmit! Use it as a listen-only monitor for your favorite repeater.

The Hamtronics linear transmit and receive converters, on the other hand, are MUCH MUCH better. I have built several of their 70cm receive and transmit converters, and the physical design is far better than that of the FM-5. The PC boards have a ground plane on top, and isolation shields are provided that do a pretty good job of keeping things stable. It's always a good idea to mount these things in tight metal boxes, however.

Phil

The following letter (with all its mispelling and poor grammar) was sent to lots of folks on the west coast of the U.S. Several in LA and San Diego received it. It appears as if it were sent from AMSAT. I can assure (as a director of AMSAT) that this letter has NOTHING to do with AMSAT. We just don't play the game this way, feeling it is all ways better to play it straight and face-to-face when we have these problems. 145.825 Mhz in particular has come to be `the educational channel' in satellite communications and I would presonally appreciate it if people could stay off this frequency with their transmitters so that we can copy the weak (and not so weak in the case of DOVE) transmitters. I wish to repeat myself, AMSAT had nothing to do with this letter.

73 and thanks for your support,

Bob McGwier, director AMSAT

Misleading letter follows:

Dear Amateur Radio Licensee

No doubt you are now familiar with the fact that our community has six new satellites in orbit.

While some of these satellites can be commanded using specially designed packet radio modem units, most are for experimental and educational uses.

The DOVE Microsat and it's [sic] telemetry on 145.825 MHz is such a satellite. It is not a BBS, nor is it an orbiting digipeater. It's [sic] telemetry on the 2 Meter band was designed for those with existing packet radio equipment interested in satellite activity to monitor satellite parameters without buying and installing specialized 9600 Baud Phase-Shift-Keyed modems and using SSB radios.

Your callsign was recently monitored by a governmental station on the above frequency. Not only is this bad operating practice, but also illegal.

Please bear in mind that the 2 Meter band from 145.8 to 146.0 is an internationally recognized amateur satellite band. In addition to the DOVE telemetry, there are several linear satellite up- and downlinks in this frequency range that are still being used.

We realize that this may be a new mode of operation among some within the amateur radio community. When leaving your station unattended to monitor the DOVE satellite, we recommend that you set the XMITOK command OFF. This will keep you, or another station from activating your 2 Meter transmitter and subjecting your station to further action.

For information about the Amateur Satellite program, please send a
stamped, self-addressed envelope to:

AMSAT, PO Box 27, Washington DC, 20044

Well, it FINALLY happened!! I was able to capture and decode
telemetry from the DOVE bird using Bob's TLMDC.EXE program.
This is a terrific program even in it's "RUDIMENTARY" form.
There was a small amount of frustration in getting the whole
operation running, all due to operator (ME!) ignornance and
error. I thought I would share with you all that I went thru
to get my station in operation. I'm sure this is not the only
configuration and I will continue to play with different
parameters to see what else works. Don't pay any attention to
the order here, I am recalling it all from memory and noting
those things that first come to mind. Well here it goes:

```
MBBIOS params:
Enter port type for this slot -----[C]
COM Number to use for this slot ---[1]
For Quadport, enter port letter ---[ ]
Harware handshaking? (Y or N) -----[N] I spent alot of time
                                       playing with these
                                       parm's. I shud have
                                       looked at the source.
Transmit blocking? (Y or N) -------[N]
More than 9600bps? (Y or N) -------[Y]
```

At first I thought my PacComm Tiny-2 wasn't handling the KISS
stuff properly so I popped in a WA8DED eprom. What I THINK the
real trouble is, is that every time you start/stop the software
you need to power on/off the tnc. If I didn't do this, the next
time I ran the software it just wouldn't work!! This week I am
going to put the PacComm chip back in and start all over. Like
I said this my pertain to my setup ONLY, but I thought I wud
share it with you.
Bob, THANK YOU !!! for the program, I look forward to later
versions.
73 for now es HAPPY TRACKING to all.

I think that source code is available for only two programs. CBBS and
AA4RE BB. For the latter, KB7TV handles distribution for a nominal
sum. The code is not for the faint hearted since its about 40,000
lines of Turbo Pascal and takes up about 2MB on your disk when you
compile it.

Bdale writes:
>What are you guys using for up/down converters?
After experimenting on 220Mhz using point to point links we wanted to
maintain our investment in the Microwave Modules transverters we bought.
70cm receive converters from Microwave Modules cost about $75 so we went
with those. A used 70cm transverter for the xmit side of the repeater
left us with only a 220Mhz receiver converter to buy.
We had to go with Advanced Receiver Research for the repeaters 220Mhz
receive converter after Microwave Modules could not come through with
anything for 220Mhz. A.R.R. is beter quality but requires a seperate
pre-amp, guess what else A.R.R. makes?
The repeater seems to be working well, although we are having a problem
with dcd falsing at the user end. It seems we have enough intermod that

some kind of bandpass filtering will be required by users living near
pager sites.
BTW, we are using a 2 cavity bandpass filter on the repeater input.
I observe no falsing of the repeater dcd.
We are using a Cushcraft 4 pole for 220 and a really nice 11.5db omni
made by Diamond for 70cm which we bought from RF parts of San Marcos, CA.
Having the extra gain at the ant. really helps make up for the 10w
output of the transverter.
Regarding switch vs repeater sites:
I guess if you can run copper from your repeater to your switch you
could use 4 wire line tranceivers. This may not be practical for you
mountain dud's!

I've been building various microcontroller based gadgets over the last year. For the sake of simplicity, they just use ROM based software rather than having RAM and a monitor and a serial port and a monitor and downloading.

I couldn't bring myself to buy an EPROM programmer and a tubeful of 2764s. The programmer is > $200 (I don't have an XT clone with a bus - I have a bus-less portable and can't use the $150 bus programmers). An ultraviolet eraser is at least $25 or $30. The turnaround time on any given EPROM is 45 minutes or more. So, yeah, you keep a handful and cycle through them. What a hassle.

You can get a 2864 EEPROM which will plug right into a 2764 socket. Programming them is close to trivial - in one of my micro- controllers (one that does have RAM and a monitor and a serial port) I use a spare socket and a short program which does the write/data poll sequence required. An 8k EEPROM programs in a few seconds. There is no erasing time. The socket you write to it in need only be configured for use with a byte wide RAM (like a 6164).

I bought some Xicor EEPROMs which were about $20 each. I've seen adds for some other 2864 EEPROMs at around $10 each. 2764 EPROMs run about $5 for 250 nS parts. The higher cost is essentially offset if you don't buy an EPROM programmer. The "near zero" tuen around time is worth the $$ alone. If you are going to reproduce a bunch a ROMs, though, use the EPROMs.

>copy of the normal firmware with KISS support included.

I have had trouble getting someone to get into col.hp.com to grab this file. Is it available for ftp from any other sites - seems from Greater Disneyland people have trouble getting files from col.hp.com - at least the people I try and cajole into midnight ftp sessions. Better yet, is it available on floppy from anyone? Or is it on a regular dialup bbs? I would really like to get my pocket TNC doing KISS. Portable tcp/ip is too good to pass up.

Any disk/mailer expenses will be covered. If I get the code, anyone is then welcome to a copy on MS-DOS disk from me.

Yours

FYI- FIXMAIL version 1.06 by Bryan DK Biggers, N9GBJ, is posted on:

pgd.adp.wisc.edu 128.104.198.22 as: FIXM106.zip (pkz102.exe, req'd to UNZIP
it, is also there.. pkz102.exe is a self-extracting ZIPfile. PKZ102.exe is
SHAREWARE from Paul Katz).

FIXMAIL is a powerful utility for dealing with Bmailer mail. V1.06 does what
the previous releases did but there are also NEW capabilities:

You can now automate the process of censoring forwarded mail.. So, if you
are gatewaying mail onto Amateur Radio bands, this IS for YOU!

If you run FIXMAIL in a Desqview window, you can invoke Desqview macros from
a 'command file' or '.TXT' file. In addition, FIXMAIL 1.06 allows DOS
commands to be in the 'command' file.. This newer feature allows you to do
some extremely powerful (possibly dangerous) things with your station.

I am a consultant to the PEACESAT Data Communication Project here at the Social Sciences Research Institute, University of Hawaii. For those of you unfamiliar with PEACESAT, the Pan Pacific Education And Communication Experiment Satellite is an association of independent, autonomous terminal sites located throughout the Pacific. Its purposes are to use satellite communication technology for education, experimentation, and health-related emergencies. All activities are non-commercial.

The objectives of the Data Communication Project are to provide a BBS-type store-and-forward messaging system with the following capabilities:

- E-mail
- Bulletin Board
- Airtime scheduling for ATS-1, ATS-3 and GOES
- Facsimile service
- Interactive Access to Remote Systems (such as OPAC, DIALOGUE, and BITNET/Internet) through a UH host computer
- Remote users in the Pacific Isles can use Honolulu hub system to automatically dial emergency numbers with automatic cut-off to voice patch

Ease-of-use is VERY important.

We have been experimenting with the W0RLI BBS software (version 11.7) as a means of providing electronic messaging and access to remote systems. I'm having a problem with the gateway feature. When I call out on port B, which has an Evercom 2400e on it, I can connect with the UH computer network, but I don't get all the prompts on my remote display, even though they all show on the W0RLI system display. Specifically, any line that does not end in CR does not come across to the remote system. This is really awkward because most of these lines are prompts to log on, provide a password, or issue a command. I have tried setting PACTIME and CPACTIME on the W0RLI TNC (a Kantronics KPC-2400), but to no avail.

Any ideas as to why this is happening and how we might work around
this?

I'm also looking for packet software that would accomplish the
above objectives and run on SCO UNIX. Any recommendations,
suggestions or comments would be most welcome!

I'm new to ham-radio, packet, UNIX, and the news groups, so if I
am missing something obvious, please excuse me.

If anyone knows the meaning of led D1 & D2 flashing in 1 sec interval on an
'83 TAPR Board I would appreciate knowing it.

Something about "unable to initialize VIA" then a barberpole display of
the BTEXT appeared shortly before the catatonic state.

I've been (slowly...seems that my domain doesn't work from Sweden!)
talking to Anders about this. There are actually two separate
implementations involved: one uses a background daemon to do the
protocols and interface I/O, and another uses streams modules pushed on
top of the TTY driver. The streams stuff will only work under
SysVr3...since I'm stuck at SysVr2, I'd like to get the other
implementation (which he refers to as NETNIX in the 8th Conference
paper), make it work on my system, and polish it up. That seems to be
the right way to do it on Unix.

These two seem contridictory. Since in one case it was pointed out
it's a location, then we asked the user to tell us the route. However,
Phil makes some good practical points, explaining why it came into
practice.

>If you have religious objections to what you see as source routing, then
>don't complain - come up with the software that will fix it.

I wish it were that easy. With the current state of (lack of) connectivity,

1200 Bd AFSK CSMA, sometimes ALOHA, real time nameservers just cant' easly be done.

It really means we neeed to rebuild the stack from the bottom up. Actually, we can build it from the bottom and top at the same time, and meet in the middle. Example, the top of the stack is BBS's, some of what goes under it top to middle pieces are the KA9Q package. For the bottom, see the Dec 89 Ham Radio magazine, plus other fun stuff we hope to be putting on line soon. Lets not forget DSY's either, on the bottom of the stack.

However, as usually happens when several pieces are worked on together, they don't always meet at their interfaces. SOurce routing and domain naming is one of these crucial areas. That's why I'd like people to realize what the names in BBS really are, and why it's only a practical solution to a problem that should be abandoned when we achieve much better connectivity.

Yes, I worship at the temple of SMOP daily.

Jim, you are so right! It works now, and solves a problem that needed problem. When network connectivity gets better, we need to realize

user applications will not all be faster BBS's, nor will the end user interface remain something so mundance as a PC :-). We need all the thoughts we can get, and we need people looking at AR saying, hey these guys are thinking up some really interesting stuff and I'd like to play too.

COme one ideas! Don't accept the status quo as the horizon!

DE: doug@w9wi.ampr.org (CQ DX 6!)

INSTALLING THE TAPR DCD STATE MACHINE IN THE PK-88

The AEA PK-88 is not among the TNCs for which detailed installation instructions are given in the State Machine pamphlet. It isn't that hard to figure out, but maybe these instructions can help someone else get theirs working faster.

First, electrical connections. As the TAPR instructions detail, the gray wire should connect to pin 26 of the 7910 modem chip (IC10); the violet wire connects to pin 25; the brown wire to pin 2; and the red wire to pin 22.

The x16/x32 clock is a little harder to find. I located it on pin 13 of the 4020 clock divider chip, IC22. This is an x32 clock, at 38.4KHz. Connect the blue wire here.

I returned the DCD signal from the TAPR board to the CD pins of JP4. This involves connecting the green wire to the jumper pin closest to the rear of the PK-88 board, and closest to the power switch. Don't connect the green wire directly to this point; it'll be too short to allow you to put the DCD board inside the case. I lengthened the green wire by splicing the black wire (discarded from the ribbon cable earlier in the installation) onto the green

wire. You could also connect this signal to pin 14 of the RS-232 connector, J1. By returning the TAPR DCD signal at this point, you can revert to original PK-88 DCD operation by simply moving the CD jumper back to its original position. (especially important to me since I wasn't too sure the rest of this installation was going to work!)

     After making this connection, move the black jumper plug nearest the power switch to the other position, so it's towards the rear of the PK-88.

     Fitting the DCD board inside the PK-88 case isn't easy! Before doing anything else, cut off the top 1/8" or so of the pins on the JMP jumper on the TAPR board. (make sure you replace the jumper plug in the 1-2 position!) I ended up wedging the DCD board between the heat sink and the AM7910 chip. To make this work, you have to loosen the front screw holding the heat sink in place. Be careful (and don't retighten this screw all the way) since you could probably crack the PC board.

     That should do it. Open your squelch and enjoy!

Just a quick note to everyone, the latest issue of "Aviation Week & Space Technology" has a picture of the satellite assembly going up on the Ariane with the microsats highlighted!!!!!! They mention the sponsoring organizations in the blurb but don't explain that these are Amateur Radio payloads...So if anyone wants to get a picture of the birds before they fly this would be a good source.

Hi. I have a Sun-2 running SunOS 4.0. I also have a PK-232
and a 2 meter HT. I would like to set up a PBBS ala W0RLI
(or whatever). My understanding is that most of these
systems run on PCs. Is there one that works on BSD 4.[23]
machines? Since the sun is a multi-user system (of course),
will the software allow multiple users? Multiple ports (if
I get more TNCs, of course)?

Any information would be most helpful. Please reply by mail
and I will post a summary. My appologies if this is the

same question constantly being asked ad nauseum here.

Hi,
   Could someone please explain the Mechanism of the Radar-Dector Dector?
How is it possible to detect a device which is only receiving a signal?
Are we talking about your typical mount on the dashboard radar detector?

Roger Smith

I'd like to run packet radio on my Sun 3/50. I could just run the
ka9q package, but I'd prefer to have all the existing {rlogin, telnet,

ftp, etc} work as is. Is there a AX.25 driver for a Sun or a box that will talk ethernet or scsi on one end and packet on the other? Can a TNC use slip for input and do AX.25 and packet on the output? Am I going to be better off using a PC as a gateway?

What would be the cheapest way to connect a Sun 3/50 (no cards, just ethernet, scsi, and RS-232 (9600 bps)) to the DSY 56kb modem? I'm not sure I care about getting better than 9600 bps performance.

==========

I have been working on the full screen mailer for NOS. I invite people to download it from HAMSTER.BUSINESS.UWO.CA ftp 129.100.22.100
I am interested in any problems encountered. I have been making changes almost everyday, so check the date code (upper right hand corner of config page) to vierify you have a recent version. Below is some intro DOCS on how to use View..
This message was created using VIEW..

VIEW - A SMTP Mailer for TCP/IP
January 1990

Introduction

View is a mailer designed to work with the networking software from Phil Karn (KA9Q). It is a full screen system that allows you to scroll through a message file
quickly and easily. Mail can be read, or new messages created. You have the choice of
selecting your own viewer and editor programs. This program creates the files, but it is
up to the external software to view and/or edit them..
View was written in Turbo Pascal 5.0. It can operate in color, or non-color modes. The
configuration page must be filled-in in order for View to operate correctly..
View was written by Mark Bramwell, VE3PZR, London, Ontario. I can be reached during the day at (519) 661-3714, and at home (519) 473-3618. View can be downloaded from the internet from HAMSTER.business.uwo.ca [129.100.22.100]. Hamster supports anonymous FTP logins. Feel free to send any comments regarding view to mbramwel@uwo.ca

Quick Setup

Copy VIEW.EXE to your computer. Make sure that you have a PATH command in your AUTOEXEC.BAT so that DOS can find VIEW.EXE

If you have been using BM.EXE for mail, then the setup is simple..
If you have not been using BM.EXE, then some directories are needed..Type in the following commands:

```
C> MD \SPOOL
C> MD \SPOOL\MAIL
C> MD \SPOOL\MQUEUE

You are now ready to start View..
C> VIEW
```

Test Drive of View

When enter View for the first time, you will have to configure it for your system. Select the f5 function key to enter the configuration page. Most items should be filled. Here is an example of some of my responses:

```
Userid:  Mark
Hostname: HAMSTER.business.uwo.ca
Realname: Mark Bramwell

Reply-To: mbramwel@uwo.ca

editor: \util\qe.exe
viewer: \util\list.com

Comments:
Signature: \spool\signatur.txt

directory: \spool\mail
Color: Y    Timezone: EST     Printer: LPT1
```

Remember to hit enter with each entry. When you have filled in the configuration page, hit ESC to save it. View will resave the configuration each time you exit the config screen.

If you had mail, then some messages will appear on the screen. If no mail is waiting, then a short message will appear on the screen..
To read a message, use the arrows keys on the keyboard to move the high-lite bar. When the desired message is hi-lited, hit ENTER to read the message..

Special Keys

Certain keys have functions assigned to them. For example, you can move the hi-lited bar by using the following keys: Arrow up, Arrow down, Home, End, PgUp, PgDn.

You can mark messages for deletion with the DEL key.

ALT-D allows you to jump to DOS without exiting view. When you type EXIT
at the dos prompt, you will be returned to VIEW at the same point that you left.
This
is usefull when you are reading large files and it takes a long time for view to
read-it-in.

ALT-F is the full display key. It opens a window at the bottom of the screen that
will
display the full hostname and subject of the current message. It can be toggled
on and
off and the mode is save in the configuration..
ALT-P will print the hi-lited message on your printer. Check config page to
ensure that
you have the printer defined..
ALT-S will allow you to save the current message to a file. View will ask for a
filename.
The message will be read and stored in that file. This will erase the file if it
already
exists. View does not append to the file..
ALT-U is the update key, and forces view to immediately update the file by
removing
marked messages. View automatically updates the file whenever you have finished
reading the file and have selected another file..
ALT-X is the same as f3. This simply exits view completely..
ALT-Z reads the current mail file and checks for EOF markers. I have found that
our
IBM 4381 sticks control-z characters in mail files. This causes view mailer to
think it is
at the end of file even though there are more messages waiting. All messages
after
control-z characters are lost. I would make this routine run all the time except
for the
fact that it slows down the initial mail file reading. Packet radio mail, and
mail directly
from the internet does not seem to have this problem..
Using VIEW

f1: Help. This displays a simple help screen for those who can't remember
     some of the special keys..
f2: Send Msg. This will allow you to create and send your own messages.
     You must enter something when View asks for 'To:'. If you just hit enter,
     then the creation of the message is aborted and you are returned back to
     the normal screen. It is not neccessary for you to enter anything in
     response to 'subject:'.

     You must have previously configured View in order for it to find your
     editor program..
f3: Quit. This exits Views, updates any messages that were deleted, and
     returns you to DOS..
f4: Read Msg. This will read the hi-lited message. You can also press
     ENTER for the same effect..

f5: Configure. Allows you to specify various items about your machine. This screen must be filled-in, else some of the functions won't work properly. All info is stored in the \SPOOL\MAILER.CFG config file..
f6: Split Digests / Read as mail. This interesting function has the ability to read mail as normal messages, or try to split a long message into its' smaller parts. I use this when I receive the info-hams digest. This takes the 400 line message, and breaks it up into all the smaller messages. It displays each host and subject separately. This allows me to read only those messages that I am interested in, and ignore the rest. This function can be toggled on/off and is stored in the MAILER.CFG file..
f7: Select file. This allows you to specify another .TXT file as your workfile. For example: I have all info-hams mail come into my machine under the userid HAMRADIO. All packet mail comes in for the userid PACKET. This creates 3 files on my machine HAMRADIO.TXT, PACKET.TXT, and MARK.TXT. Using select, I can choose which information I am interested in reading at this time. Any marked messages are deleted before the new file is read..
f8: Credits. Who am I, and where can I be reached. Also note the date code in the upper right hand corner of the screen. This will allow you to know which version of the software you are running..
f9: Forward a Message. This will read the current message and allow you to forward it to someone else. I use this to send a copy of interesting mail to my home machine.

f10: Reply-to. This will create a message using the hostname, subject, and text of the hi-lited message. It allows you to reply to a message that you are reading..

You might want to set your TNC's passall parameter OFF, so that even slightly
erroneous packets can be received. The above telemetry might not be 100%
error proof, due to this setting.

DOVE is a brand new OSCAR satellite that transmits telemetry on 145.825 MHz
using AX.25 protocol.

I just had a chance to copy some of DOVE's telemetry. During a 14 minute pass,
I copied 289 packet frames, or about 31 kilobytes of data. Here's just a SAMPLE
of what I copied, only about 26 hours after launch:

```
DOVE-1>TLM <UI>:
00:58 01:59 02:88 03:32 04:58 05:58 06:6D 07:3F 08:6C 09:60 0A:A1

0B:DD 0C:E8 0D:D8 0E:01 0F:24 10:CC 11:AE 12:00 13:01 14:B2 15:9D
16:99 17:91 18:95 19:94 1A:91 1B:87 1C:9A 1D:98 1E:24 1F:5D 20:BE

DOVE-1>TLM <UI>:
21:9B 22:7B 23:22 24:1E 25:2E 26:00 27:00 28:00 29:00 2A:00 2B:01
2C:00 2D:2A 2E:00 2F:9C 30:C8 31:9C 32:B6 33:0F 34:C5 35:A2 36:A8
37:9C 38:BB 39:98 3A:00

DOVE-1>STATUS <UI>:
 00 00 00 88 B0 18 BB 01 00 B0 00 00 B0 00 00 00 00 00 00 00

DOVE-1>BCRXMT <UI>:
vbat= 10.877 vlo1= 10.540 vlo2= 10.040 vmax= 11.540 temp=  6.661
```

Note that all frames are <UI> frames (Unnumbered Information) addressed to different "Unproto" designations (they are transmitted as beacons and do not require "connection" to receive.

DOVE, a product of the efforts of AMSAT of Brazil (Bramsat), currently transmits on 145.825 MHz FM, with packet beacons ON for 2.5 minutes and OFF for 30 seconds.

Pretty neat, huh?

73, de John, KD2BD

For putting a UNIX system on packet, I recommend the setup I use:
Ethernet from the UNIX system to a dedicated PC/XT clone acting as
an IP router between the Ethernet and the packet radio modem (56kb/s
in my case, but it would also work with 1200 baud KISS TNCs).

This technique has a very important advantage, namely avoiding the need to
make any modifications to the UNIX system. You also get the benefit of
the PC's CPU in driving the radio interface, offloading that job from
the UNIX system.

You should make sure that your TCP is reasonably up to date so it will
perform reasonably well over the (slow) packet channel.

     You may want to send $2.00 to:

Tucson Amateur Packet Radio (TAPR)
P.O. Box 12925
Tucson
Arizona 85732

(602) 323-1710

Ask for: Disk 19 LAN-LINK G3ZCZ Terminal Program

     As I recall LAN-LINK is a shareware program, but don't quote me.

     TAPR has a fair range of packet related software for MS-DOS
machines. The price is $2.00 per disk and you are assured of
getting the "Latest and Greatest". If you call the number above
they will send you an order form and price list. And while you
are at it, join TAPR and get their newsletter.

Yours

I am having trouble with the "initial alignment" steps on a RadioKit
G3RUH PSK Modem kit.

Steps 1 thru 3 all okay.

#4 Adjust VR2 (with VR3 at mid-travel) so that the meter is exactly centered.

"DOWN" led lite. I adjust VR2 clockwise meter goes right to center point.
"DOWN" led stays lite. Any adjustment to VR3, "DOWN" led stays lite.

"DOWN" led lite. I adjust VR2 counter-clockwise meter goes left, "LOCK"
led comes on, then finally both led's go out and meter springs to center
point.

#5 Set VR3 fully clockwise, re-adjusting VR2 if meter moves from center.
   Reset VR3 to mid-position. Neither "UP", "DOWN", nor "LOCK" led's
   should be lit.

Well as I explained above this just isn't happening. Any help would be
GREATLY!!! appreciated.

Thanks in advance, and hope to see ya on the birds SHORTLY. (I hope)
73, Terry

     Could some kind soul please post the formulas for the DOVE
microsat telemetry?

     I hope that AMSAT's not going to force us all to BUY the

information, or ready made programs (grrr). Fine for the people that
want to go that route.

     Bravo to the volunteer efforts to get them up there though!
That DOVE satellite comes in just a booming. I now gots lots of data,
but can't make much sense of the HEX.

     I guess I'll have to write and mail off an inquiry, *sigh*,
and see what the story is on this. Er, find out how much it costs.

In article <323@kd9uu.ampr.org>, pat@KD9UU.AMPR.ORG (Pat Davis, KD9UU) writes:
> DE: doug@w9wi.ampr.org (CQ DX 6!)
>
>   INSTALLING THE TAPR DCD STATE MACHINE IN THE PK-88

     My installation instructions are somewhat different than
KD9UU's. Both of our installations work. Mine has the board
mounted as a dongle board, and I attach my wires to different
physical locations. This is a major improvement to the operation
of the TNC. I strongly recommend it.

STATE.PK88

How to install the TAPR DCD State Machine Board in an AEA PK-88

                                By

Julian Macassey, N6ARE

Assemble the board as per the TAPR instructions. You do not have to insert the ribbon cable. It is better to use shielded cable as will be explained later.

The board will not fit inside the PK-88 case. Find a metal box that will fit the State Machine board. The board can be fixed inside the box with double sticky tape. Wire up the box as follows:

PK-88 to State Machine Interconnection

P1 (State PCB)	PK-88 points	Wire function
1 (Brown)	Cathode D5	Plus 5V
2 (Red)	Cathode D4	Ground (Shield)
3 (Orange)	Not Used	
4 (Yellow)	Not Used	
5 (Green)	JP4 CD center	DCD Out
6 (Blue)	IC-20 Pin 13	X16/X32 Clock
7 (Violet)	JP4 CD end	DCD In
8 (Grey)	JP4 RD center	NRZI Data In

The colors in brackets above refer to the ribbon cable supplied with the kit. If you use this cable, you will have to find a way to feed this out of the case of the PK-88. Should you choose to use a shielded cable to connect between the PK-88 and State Machine PCB, you can feed the cable through hole in the PK-88 box between the DC connector and DB-25 connector. This hole may be marked "INT/EXT SW". When using shielded cable, the shield should carry the ground so connect to position 1 on P1 of the State Machine PCB.

The connections within the PK-88

Owing to the design of the PK-88 box, it is hard to install these mods and have the case easy to open and close. To understand these instructions it helps to have the PK-88 schematic and board layout diagram in front of you.

First you need to connect the power and ground. The power should go to the cathode of D5. This is the output of IC1 the 7805 Voltage Regulator. You will find a better place to do this is at the other end of this trace which is just behind the fuse. The ground should go to the cathode end of D4. This is the ground to IC1. The purpose of keeping these power connections together and as close to the regulator as possible is to reduce noise.

Next the clock connection (P1 6). You can attach either to

pin 13 of IC-20 or pin 13 of the DB-25 connector. The source of the clock is pin 13, this should give a better signal.

The tricky bit is the connections across the jumper pins "cd" in the "JP 4" block of jumper pins. JP 4 is three sets of jumpers of 3 pins each. With the board in front of you with the DB-25 connector to your left, the top jumper is "cd". It is marked on the board and diagram, but is hard to read. Connect the "DCD Out" (P1 5) wire to the center pin of the jumper. Connect the "DCD In" (P1 7) wire to the end pin of the same jumper. The end pin is the one furthest from the DB-25 connector.

The final wire is "NRZI Data In" (P1 8). This wire is connected to the center pin of the center jumper. This is the jumper marked "RD" in the drawings, some TAPR documents call this RD or Receive Data as well as NRZI.

Replace the shorting plug on the center (RD) pins of JP4. Discard the jumper of the top (CD) pin of JP4.

You have now installed the State Machine Modification. It will work with standard AX.25 use.

KISS USE

For KISS use with KA9Q TCP/IP you have to make sure that pin 8 of the DB-25 is wired to the computer, also that the jumper JP3 has been moved to the correct position. See Paragraphs 2.8.2 and 2.13.1 of the PK-88 manual. Also it appears that the state mod will only work in KISS when using the May 89 PROM. Earlier versions do not seem to work in KISS. The later PROMS are the ones that go into KISS with a single "KISS ON" command.

Effective immediately the Packet-Radio mailing list has moved to
UCSD.EDU. All Internet and BITNET readers should send their postings
to packet-radio@ucsd.edu and administrative requests (additions or
deletions to the mailing list) to packet-radio-request@ucsd.edu.

The only difference you will see is that the mailing list will no
longer be a digest. Individual messages will be forwarded as they are
received.

Your new mailing list maintainer is Brian Kantor <brian@ucsd.edu>.

How much throughput can a PC handle as a dedicated gateway? For various
CPUs: (8088 @ 8 Mhz, 80286 @ 12 Mhz, 80386sx @ 16 Mhz, 80386 @ 25 Mhz)
what might be the typical maximum number of 56 KB connections it can keep
up with? How much memory might each need? I guess this would depend on
the "mechanics" of the serial I/O port... interrupt-per-byte vs DMA|dualport.

Thanks for the info, Doug. Has anyone in your area tried Hamtronics converters?
I have had unsatisfactory experiences with their receivers and transmitters,
am wondering if their up/down converters are any better. I know WB6CYT has a
couple of boards, but I don't think he's got his modem on the air yet... and
a couple of the locals are interested because of the cost.

>90%/10% - class B has taken us far enough along is the premise of my
>position. Getting the last 10% is going to cost more.

Sure it's going to cost more. But even if it's more than a 10% increase, it
would mean, for me, the difference between whether I can run something off the
shelf, or whether I've got to "open the box" and push and poke and tweak and
patch before a new piece of gear will work in my shack...

I've got so much rf-generating computer gear in "the Bit Basement" right now
that even my ATT cordless phone is nearly useless... unless I stand still in
one of the magic "quiet spots"...

>If you think all of this is going to pass through to the consumer as a

>5 cent ferrite bead and a couple of bypass caps, think again.

I don't think anyone who has done product design work (and most if not all of us in this discussion have) really believes there are any 5 cent solutions. But I think the point Phil is making that I'd like to strongly echo, is that it would be worth almost "whatever it takes" in initial purchase cost to fix this problem, because if the problem isn't fixed, we get to spend our own valuable time re-engineering the shielding and bypassing of nearly everything we buy! And that's time that *could* be spent, oh... say..., writing TCP/IP software improvements... :-)

The problem is bad enough that many local hams with a simple TNC and radio hooked to their PC can't copy packets that "sound great", in large part because of the amount of hash on their *audio* lines from their computer gear. Amazing how many TNC manufacturers ship cables for the radio in/out that are not even shielded...

Never mind the RF susceptibility problem. I had real problems with a Paccomm TNC-200 for a while, which I finally traced to partial saturation of the PTT FET by the RF from the transmitter. Caused the PTT to "latch up" once in a while, with predictable results... graphic proof that certain commercial radios aren't designed for 100% duty cycle!

I have had trouble getting someone to get into col.hp.com to grab this file. Is it available for ftp from any other sites - seems from Greater Disneyland people have trouble getting files from col.hp.com - at least the people I try and cajole into midnight ftp sessions.

We had a real problem with col.hp.com, that I think I fixed last Friday by updating to the latest os and networking code. Try again, and if it's no better now, please let me know! If it helps, the IP address is [15.255.240.16].

>Am I going to be better off using a PC as a gateway?

Probably. It's cheap, and a lot easier.

>What would be the cheapest way to connect a Sun 3/50 (no cards, just
>ethernet, scsi, and RS-232 (9600 bps)) to the DSY 56kb modem? I'm not sure
>I care about getting better than 9600 bps performance.

If you go the PC route, right now the best option is a DRSI PCPA card in the PC using Phil's HS high speed driver. If you're not going to actually do this until, say, Dayton-time, look for the K3MC Awesome I/O card from DRSI. It's the right thing to do.

I.M.H.O., your attitude SUCKS! We are struggling like mad to provide
you with these satellites and people like you are THE reason we are
struggling. We are completely within our rights to withhold ANY information
that enables us to support our cause which is to build and PAY for these
delightful toys. HOWEVER, just so you know we are not the jerks you
think we are, and even though it is costing us REVENUE THAT PAYS FOR THESE
THINGS YOU ARE SO HAPPY ABOUT: the telemetry equations, along with
SHAREWARE telemetry decode programs, ALONG WITH SOURCE are available
for download for Compuserve, Dallas Remote Imaging Group (the official
AMSAT) BBS (NO I don't remember the number), and for anonymous ftp
on tomcat.gsfc.nasa.gov. The version on tomcat is a couple of versions
old and I will make EVERY attempt to get the new ones up there. The one
on TOMCAT has a couple of annoying bugs. I wonder if folks like you think
we are the national treasury and can just print off the money it cost
build these birds? We paid about $100,000 a piece for them and for a
non-profit organization that ain't peanuts.

The corrections having finally stopped trickling in, this is probably
an up-to-date list of the AMPRNet IP address coordinators.

Corrections to me, please.
- Brian

AMPRNet IP Address Coordinators - 20 Jan 1990

44.002	Bob Meyer	K6RTV	Calif: Sacramento
44.004	Douglas Thom	N6OYU	Calif: Silicon Valley - San Francisco
44.006	Don Jacob	WB5EKU	Calif: Santa Barbara/Ventura

How does one receive signals from DOVE? What sort of special antenna is needed?
Also [it looks very interesting, but....] What does all that telemetry MEAN?
Will my PK-88 and Kenwood HT be able to receive all this wonderfulness?
Thanks in advance.

kevin@calstate.bitnet
kevin@ccs.calstate.edu <--preferred.
sorry, my normal .sig is off on holiday somewhere without me.

Here's a copy of what I received from DOVE on Tue Jan 23 03:07:18
1990. I am using the KA9Q TCP/IP software package.

501 recv: [Mon Jan 22 22:06:13 1990]
AX25: DOVE-1->STATUSUI pid=Text
0000
501 recv: [Mon Jan 22 22:06:13 1990]

Like I said I am using KA9Q software and you'll have to match the
data with the appropriate beacon. BTW, I love using KA9Q on
packet!!! You really should give it a try. 73 es gud luck on the
new birds.

THANK YOU AMSAT!!! FOR GIVING US THE NEW SATELLITES.

I captured some of DOVE's telemetry as it passed overhead last night -- now
I've got the bug. Where can I find info on the purchase or construction of
a "PSK" modem for my TNC-2 clone?

Mike Westerhof (KA9WSB)

>what might be the typical maximum number of 56 KB connections it can keep
>up with? How much memory might each need? I guess this would depend on
>the "mechanics" of the serial I/O port... interrupt-per-byte vs DMA|dualport.

At 56kb/s, the answer is currently 1. This is because of how the "hs" driver
is implemented; there wasn't enough time to handle an interrupt on each
character, so I busy-wait whenever the receiver is active. NG6Q and WA3CVG
have come up with a version that uses DMA, but there you are limited by
the number of DMA channels on a PC.

>> You should make sure that your TCP is reasonably up to date so it will

>
>Van Jacobsen?

Yes, plus the Nagel and Karn algorithms. All are now required elements
of TCP according to the Internet Host Requirements Spec, RFC-1122.

Phil

>> all to BUY the information, or ready made programs...
>
>I.M.H.O., your attitude SUCKS! We are struggling like mad to provide
>you with these satellites and people like you are THE reason we are
>struggling.

    Whoa, campers! Obviously I have struck a nerve here. Its
very simple. I push satellite operation and AMSAT membership in my local
area as much as I can. But my funds are limited as is every one elses.

    I have my $45 AMSAT membership this year, and what I've got fer that
is 3 - 4 page bulletins. Now I don't complain, because the money is helping
fund other projects like the one we've just seen and that is fine.

    But its vy difficult to "home-brew" if someone holds the information
for ransom. After all, don't we home brew anymore? Anyhow, one hour after
I posted this request, I read somewhere that someone was going to make it
generally available, and I felt bad about posting the above, but like
all the other times that I put my foot in my mouth, its hard to retract
such things without changing feet!

> We are completely within our rights to withhold ANY information
>that enables us to support our cause which is to build and PAY for these
>delightful toys.

     If an attitude sucks, this might be a gud one to pick on. If
amateurs are volunteering and donating to make it possible in the first
place, then deliver the goods... don't ransom it. However, I'll bet that
like most things that these sort of things often run deficits that are
hard to later collect-- creativity I think is called for here.

     Keep in mind that I am one of a few (these days) that like to
learn something by doing it myself. For those who don't have the time
or whatever, kits are just fine, and u gets what ya pay fer. I DON'T
WANT someone else's software. I do that professionally, and for whatever
twisted reason I might have, I WANNA DO IT MYSELF (the telemetry program
that is). If I do it beacuse I'm cheap, or poor, it might just prevent
me from dropping my AMSAT membership, when the xyl complains.

     The growing trend that I keep fighting at ham clubs and new members
is this "save up and buy it" attitude, rather than creative do-it-urself
stuff. There of course is a limit when it comes to the birds, but a careful
balance is required.

> HOWEVER, just so you know we are not the jerks you
>think we are,

     I think u put words in my mouth here... that was not said or
implied.

> and even though it is costing us REVENUE THAT PAYS FOR THESE
>THINGS YOU ARE SO HAPPY ABOUT: the telemetry equations, along with
>SHAREWARE telemetry decode programs, ALONG WITH SOURCE are available
>for download....

     Again, I didn't ask for a free ride. I'll do the work myself,
and I'll be glad to pay cost of publication/mailing if need be. But
I can't lift a finger until I get the necessary information. I just thought
it would be nice to get it on USENET, since so many people have access to it.

     I can't keep people locally interested in the birds, when all they
see is numbers that they can't decode. Tell them that they need to buy
the computer that AMSAT's collection of programs run on (which might not
be what they have-- take an Osborn CP/M for one example), and that it costs
$20-50, and interest will last one week and die.

     If ur close to the action, its vy difficult to see things as
we often do, as mushrooms in the dark. :-) Unfortunately, I don't have access
any of the sources u gave, but I'll do some digging.

> I wonder if folks like you think
>we are the national treasury and can just print off the money it cost
>build these birds? We paid about $100,000 a piece for them and for a
>non-profit organization that ain't peanuts.

>Bob McGwier, N4HY
>Microsat devotee

I'm one of the first believers in the "no free lunch" principle. But if u want support, u've got to tread a fine line to get that volunteer support and KEEP it. I think over all, things have been vy good. After all, no organization is perfect.

So to answer ur question, no I don't expect a free lunch. But I wasn't asking for one was I? I just asked, perhaps in a slightly frustrated way, for some information-- so I could do some work for myself, and perhaps stir up more local interest.

I'm not aware of the extent of YOUR involvement, but certainly a good job was done by all getting the birds up there. Now that they're up there, lets HELP each other USE them. Turn off the bunsen burner, eh?

The entry for Switzerland HB9SFD is I believe correct. The locally given entry is HB9CAT @ HB9GL (AX25 address).

As a fellow AMSAT board member, I feel I ought to add some comments of my own to those of N4HY.

It shouldn't be a surprise that since the launch, people like Bob and myself have been deluged with requests for information about the Microsats. I usually respond along these lines:

"Join AMSAT. All the basic information you want is already being distributed on a regular basis to AMSAT members via the Amateur Satellite Report (newsletter) and in the AMSAT Journal (containing more detailed technical articles). It's really not that expensive, and you'll also help support the organization that put up the satellites. Write to AMSAT, PO Box 27, Washington DC 20044, or call 301-589-6062."

This appears to offend some people, who seem to think that AMSAT is out to "sell information" to "make money".

Nothing could be further from the truth. First of all, AMSAT is a 501(c)(3) corporation. That means "nonprofit". NOBODY gets rich from "working" for AMSAT -- but you can, and often do, become poor! As a Director, I receive regular monthly statements about the financial health of the organization, and I can tell you that this year it has been mostly red ink. Satellite launch years are always a heavy drain on the organization's reserves.

It shouldn't be hard to understand why. Although almost all of the actual work is done by volunteers and we hit up corporations for donations of surplus space-rated parts whenever possible, there are some things you just can't get for free. Airline tickets to French Guiana, among many other things. Not to mention our launches, which are now starting to cost us more than token amounts of money. Sure, we could stop launching satellites, but then why should we continue to exist?

As amateurs, we are forbidden from charging for the use of our satellites. And I doubt we would even if we were allowed to -- unlike some repeater autopatch groups I know. We prefer to raise money through voluntary donations. But the Tragedy of the Commons is ever-present. It's just like public TV or shareware software; without a quid-pro-quo relationship between being a member and getting the service, you'll always have a lot of users who don't support the organization. (Some would use the term "freeloaders", but I'm trying to be polite.)

So we've had to emulate public TV by offering something tangible in exchange for membership. Public TV stations give their members monthly program guides; we give ours newsletters. We also sell copies of satellite tracking software. Yes, we're well aware that newsletters can be photocopied and disks can be duplicated, just as satellites can be used by non-members. But that hasn't kept us from selling enough copies of N4HY's Quiktrak to make the difference between being here now and folding up for lack of funds years ago. So apparently there are SOME people out there who think it worth giving something to AMSAT for the enjoyment they get out of amateur satellites even though they're not forced to do so.

There's an even more basic reason for responding to requests for information by saying "Join AMSAT!" It's very simple: the information you want already exists, and it is much easier for us (and you) to get it through the usual channels than it is for us to have to answer the same questions over and over on the net. Those of you who have ever worked as programming consultants (or have used their services) are undoubtedly familiar with the term "RTFM!"; this is really the very same situation. Consultants don't mind answering questions as long as they feel the person really needs their help.

Bob is one of a half dozen or so people who have completely committed themselves to the Microsat project for the past two years. I'm not one of them; my own commitment to amateur TCP/IP has been more than a full-time activity for over four years now, so I've not personally been able to give much more than moral support to the Microsat project. (I do understand it's flying my AX.25 code.) Nevertheless, I have been close enough to the project to see the incredibly intense dedication of each of these guys, and the constant personal and financial sacrifices they make.

It is certainly not the lure of money that motivates these guys; if any revenues accrue from AMSAT's licensing agreement with Interferometrics, 100% will go back to AMSAT to fund future satellite projects. No, they are doing it because they really feel they're creating something radically new and useful for the amateur service and for the world. Perhaps it is a little unfair for them to expect everyone else to share their same level of dedication. But it is much more unfair for the amateur world to ascribe selfish motives to them, or to expect them to bend over backwards just so they can "save" someone the cost of an AMSAT membership.

To close on a somewhat lighter note, I would like to point out that I earlier used the words "committed" and "commitment" rather than "involved" and "involvement". This was deliberate. As WA3ZIA (one of those "committed" to the Microsat project) is fond of pointing out, the difference between

being "involved" and being "committed" can be seen in your morning breakfast
of eggs and ham. The hen was "involved" while the pig was "committed". :-)

73,

Phil

From article <9001250027.AA00912@brambo.UUCP>, by wwg@brambo.UUCP (Warren W. Gay):
>
>   I'm not aware of the extent of YOUR involvement, but certainly
> a good job was done by all getting the birds up there. Now that they're up
> there, lets HELP each other USE them. Turn off the bunsen burner, eh?

I apologize for my losing it. Yes, you struck a nerve. I had just handled
the twentieth phone call on Microsat's AT WORK, I spent all night rewriting
the code that runs on board inside NK6K's kernal, I had to peek at 300
addresses on four satellites in three twenty minute passes to debug a
problem, I had to listen to mother Martha complain about how we had
overspent our Microsat budget by $60,000, and in general I had had all
I could take for one day and then I read your note. Its no real excuse for
blowing up but I thought the circumstances might be informative.

My involvement ;-)? Your joking right?

I wrote Quiktrak, I managed the computer development for the Microsats,
I wrote the command, control, and telemetry software whose output you
are watching on your screens as they go over. I designed and built the
DOVE experiment (the DOVE experiment design was modified at the insistence
of Tom Clark to add the BEL-202 modulator, way to go Tom. Brooks Van
Pelt, KB2CST and Pat Spatafore, KA2MOV did the layout and most of the
soldering on the DOVE boards). I am member of the board of AMSAT and
I gave up two months of unpaid leave of absence this year solely for
Microsat. Larry Kayser, VE3PAZ asks if you no the difference between
committed and dedicated? Dedicated is the chicken that lays the egg,

committed is the chicken you get from Kentucky Fried. The folks who worked on these birds were definitely committed. The level of altruism, personal sacrifice, and more still makes a lump come to my throat. If the things died tommorrow, I would be satisfied that we had done all we could in a mission impossible and had brought it off.

I apologize to those of you who are calling the office and getting shit from Martha about wanting information and not being a member. I have moved to end this practice. She is going to be given a list places to steer you to get info. We do not have the money to give away all the papers describing the system, etc. ;-) but we will do everything we can to help.

Bob

COULD someone please clarify the difference (in terms of
how it affects BBSs) between a LOCATION and an ADDRESS?

Understanding this seems fundamental to why

K3MC.CA.NA is necessary over just 'K3MC'. Although so
Mike can have more than one thing, I'd allow bbs.K3MC.ampr.org.

Due to a faulty tape recorder, the launch of the Spot-2, Microsat, UOSAT
payloads on the Ariane 40 configuration (the first 40, no strap ons) has
been delayed until at least January 26 at 0135 UTC. I will post new
orbital elements on CI$ and AMSAT BBS's. The tape recorder was not
on the small sats of course, it was on the multi-million dollar
SPOT-2 earth imaging, earth resources satellite. This quite serious
delay is pushing the already delayed launch schedule for ARIANE further
into the future.

>SO WHAT'S THE BIG DIFFERENCE?

The big difference is that in NET/NOS, we acknowledge that the static 'route' command is a poor substitute for an automatic routing protocol. It is clear from the syntax that naming and routing information are separate entities. And when RSPF/RIP/Whatever begin to enjoy wide use for route generation between IP switches, the only thing an end user station will need to do is to insert a 'route add default ax0 <local_switch_name>', and everything else will be automagic.

The point has been made elsewhere that the BBS H addressing isn't actually source routing, but is a combination of a flat address (the callsign part of the "hostname"), and geographic routing hints (the .CO.USA.NA part). The confusion, and in large part the concern within the IP world, is that addressing and routing are separate issues, and the dot-notation syntax makes this appear to be a pseudo-domain-name, which it's not, and a concern that the folks building BBS software really understand the distinction between addressing/naming and providing routing hints.

W9NK (I think) has made an interesting proposal on tcp-group that is being looked at, which would change the syntax of addresses on the PBBS side, and clarify the distinction between the flat address space callsign, and the routing hints. I think it's likely that some change from the dot-notation will likely be addopted by the PBBS authors, eventually.

I don't think what they're doing is *wrong*, it's just misleading, and in many ways a less than optimal solution.

>Also, my comments concerning the "RELGIOUSITY" of certain individuals is
>not meant to "deny them first amendment rights", it is that this
>attitude has created a dictatorship of the "AMPR.ORG" domain and Network
>"44" ... This dictatorial attitude prevents any democratic aproach to
>the question of subdomains, administrative subnetworks which can use
>geography for pragmatic reasons (eventhough you see geographic subnets
>in internets all the time), summary decisions to allocate less that full
>byte subnets without user input, etc. (I found the DIETY, MOTHER, and
>ADDRESS analogy very telling).

Hmmm. It may be "very telling", but it avoids the basic issue, which is that religion is being confused with experience. Unfortunately, and at the root of the real problem, is that the "in crowd" in AMPR.ORG have had to answer the same questions about geographic routing 1e6 times in the last couple of years, as new users come online and get wild ideas in their heads, and become confused about the issues of addressing and routing, after reading well-meant articles and papers by folks in the amateur packet community who do not have much depth of experience building real internetworked systems.

This is unfortunate, but strikes me as more of a communication problem than a "dictatorship"... The attitudes of individuals may get to seem "dictatorial" at times, but I think it's more out of boredom from explaining the same thing for the n'th time than any real reflection of attitude.

>I would say that a
>majority of users just want Email and Bulletin services, lets make the
>path easy between them and those who want the higher services of
>networks like IP.

Agreed. And believe it or not, this exact wish is often at the root of
complaints about the PBBS H address syntax and semantics. It generates a lot
of confusion, and in some ways makes generating reasonable gateways and
reasonable addressing rules harder for both sides...

Le Huh?

The KISS for the u21 that I made available is a copy of all the functionality
provided in the standard firmware, plus KISS ala the TAPR 1.1.6 w/KISS EPROM.

It is *not* KISS-only, and as such, there's no need for piggybacking, or
anything!

RE: Using KISS only ROM's.

I find the idea of throwing away functionality offensive. It's sort of
like throwing away compatibility to save 5 cents per component; nudge,
nudge, wink, wink...

RE: Kludging in both ROM's piggyback.

I don't mind voiding the "90-day-but-that-doesn't-include-software" paper.
And I have to admit that I didn't go look at the schematics, but.
The described method may also cause design rule violations; fan-out for one.
Yeah, yeah, it's picky but a 1->n ROM piggyback board would seem to be a better
answer. (Actually, throwing the whole thing out and starting over sounds
like more fun. All I have to do is find some company to foot the bill. heh,
heh, heh...)

This version is a combination of Phil's work, from Russel Nelson and PA0GRI.
Phils mods include tracing into a file (trace interface tracelevel [file])
If file is not given output is redirected to the screen.
From Russel Nellson are his mods as contained in diffs.arc.
They include:
a)
Arcnet support where arcnet uses the packet driver interface.
b)
The fcntl control call and command.asm mods. This makes NOS run through when
shell escaping to DOS as a tsr. (no smtp hangs anymore. Even trace goes on)
c)
Interprosess comunication via int 0x2f (for rlogin client)
d)
Logging of MKDir and RMDir commands.
e)
If you have a anonymous account in your ftpusers file any user name will be
accepted and mapped into the anonymous account. (seems not "everybody" knows
anonymous account, In europe guest is used in net/nos often)
f)
The JOINed disk (if used) is found and statused if a dir is done on the joined
drive.
g)
Multiple directorys can be accessed on the same level. Normaly there is a
root directory. In ftpusers it is like "anonymous * /dir1;/dir2 1"
(directorys are separated by ; and no "white space" is alowed.
h)
A net.rc (aka .netrc) file is supported for ftp access to other machines.
This auto logins you to the destined machine.
Format is "system username password" . Note that it all is clear text.
net.rc lives in the root directory.
i)
I did not find the rlogin client so that is not added but some hooks are
in place.

j)
Tar backup feature! If you specify 'recv direct/tar/*.* than all files
in direct are tarred into one destination file. This is great to backup
a single directory into (onto) another system. I did not encounter speed
degradation in backing up my NOS directory onto my UNIX system via ethernet.
On a destination /tar/ read it should expand the tar file again.
a)
From PA0GRI the domain mods are included.
b)
autoexec.net is called autoexec.nos to make a difference on people using
both NET and NOS and dont want to switch between configuration files.

I uploaded nosadd.arc and nosgri30.exe to flash.bellcore.com in the files
/pub/nosadd.arc and /pub/nosgri30.exe . nosadd.arc contains all changed files
against nosv30tc.arc (phil's nos.arc 900105)
Also on wb3ffv and gvdgpc bbs systems both files are uploaded.
Note: nosv30 is phil's 900105 release.
Regards. gerard.

Kenwood HF transceiver model TS-440S (with general coverage receive)
S/N 7060175
Stolen during breakin of Synton ARC station between Jan 5 and Jan 8 1990.

Features installed:
    AT-440 auto antenna tuner

    YK-88S 2.1 khz SSB filter
    YK-88C 500 hz CW filter
    10 hz display mod

If you find this radio, contact local police or:
    University of Illinois Police
    Officer Frost
    Case I90-0031
    Phone 217-333-1216

>Jay, What's the "common sense" that you speak of in SOURCE ROUTING?
>The quickest problem to point out is what happens to your traffic
>when one of the routers in the path goes away? And how do you discover
>the new path?

As has been pointed out here and on tcp-group, WB5BBW@HOU.TX.USA.NA is
not a route, it's a location. All it says is that WB5BBW is in Houston,
which is in Texas, which is in USA, which is in North America. It says

nothing about how to get the message to any of those geographic
locations.

The common sense I was referring to was the part about how we should
drop the religious objections and get on with making things work well.

You may not be referring to us, Julian.. Since I don't recall any promised
publication of details...but anyway......

GRAPES has three KA9Q switches "Mountaintop" interconnected with 56K modems
here in N. Ga.. All of them have 1200 baud channels (most more that one).
These switches make up the production AX.25 and TCP/IP network
(Net/Rom will be integrated soon (Thanks, Dan)) for N. Ga. We are not
building a parallel network for IP.

One of the switches has a full duplex 1200 baud repeater for the LAN.

I'm sorry to say that a full duplex 56K LAN is still on our "wish list",
since our kit and switch building activities have taken up most of the
energy needed to build the necessary hardware.
The switches we have are running simplex 56K.

I'd be happy to answer any questions on our setup, if it's of any interest
to you.. I'd also like to hear about others who have production switches
and/or 56K on the air full time especially Full Duplex.

Just wondering if any of the PBBS packages (RLI, MBL, AA4RE, etc) have any
provisions for forwarding traffic via dialup modem? I guess it would work
something like UUCP. We have a problem here in Mpls/St. Paul..in that
most of our outside world traffic comes and goes through a connection
called the "Gofar Hole".

This Gofar Hole is a piggy back connection
on top of a private corporate network. A TNC in MSP is connected to
the sio line of Sun...the Sun talks to another Sun in Maryland via the
network...and the sio of that Sun is connected to another TNC which
finally puts the stuff on the air. Both TNCs are NET/ROM'd.

This all sounds great except that the link is down more often than
it is up. It's not a high priority for the people who own the
Suns and the network...to restart the processes that keep the AX.25
traffic moving... consequently, we don't get any new packet traffic
for days and days. The most frusterating part for me is not getting
AMSAT bulletins. When we finally get them-- they are weeks, sometimes
a month old!

What I would like is a fall back connection via dialup modem. If
the PBBS determines that forwarding via the Gofar Hole (or worm hole
of your choice) is failing... then it will dial the other PBBS on
the phone. If we were really smart, we'd compress the traffic using
.ARC or .ZIP techniques and then use MNP on the link for reliability

and speed.

I work for a modem company-- hence v.32 9600 baud modems for
each end are feasable.

Any ideas? flames?   Chris   N0JCF

Subject: TAPR Annual Meeting

ANNUAL TAPR MEETING - TUCSON AZ - SATURDAY AND SUNDAY - FEBRUARY 24th - 25th

The TAPR annual meeting will be held at the Inn At The Airport, 7060 South Tucson Boulevard, Tucson AZ, 85706. The Inn is a very short distance from the airport terminal, walking distance if you're so inclined. Special rates for the meeting are $49.00 for either one or two in a room. Breakfast is included as well as a late afternoon cocktail hour. Our room block will be released on February 9, 1990 so get your reservations in prior to that date. Call 1-800-772-3847 if outside Arizona, 602 746-0271 if in Arizona, or write the above address. Cite The TAPR Conference to assure rates.

There will be a registration fee of $20.00. This fee will help to defray meeting costs plus lunch and private dinner at the hotel. Since breakfast and cocktail hour are provided to those staying at the hotel the overall cost is quite nominal. The Sunday session should be completed by noon or shortly thereafter for those planning return travel on Sunday afternoon.

Networking, that's the packet radio buzzword for the early '90s. And that will be one of the main topics at the 1990 TAPR annual meeting. Equally exciting will be discussions by members of the Microsat team describing and graphically displaying the construction, pre/launch and launch activity of the Microsats and their UoSAT cousins.

Expect to see many of the manufacturers of packet equipment present with

displays and demos. Some have already contacted TAPR for arrangements. All the new TAPR kits will be shown and discussed.

Those wishing to be on the speaking agenda should advise the TAPR office as soon as possible. The Sunday session should be concluded near or shortly after noontime for those planning afternoon departures.

```

Note: Packet Radio is a computer communications mode of Amateur Radio.

  PACKET BID: 29730_W3IWI

  1990 is going to be a vintage year for amateur packet radio in space.
  This month will see the launch of the four AMSAT Microsats plus two
  UoSATS (look for @AMSAT bulletins on you local BBS).

  Then in late April one of our MDC area astronauts, Ron Parise, WA4SIR
  will fly on the Shuttle Columbia in mission STS-35. Ron will be carrying
  2M packet radio hardware with him -- a modified HK-21 TNC, a Motorola HT,
  a window-mounted antenna and a Grid lap-top computer.

  The TNC will be carrying special software -- an updated version of the
  SAREX "Robot" that would have flown in 1986 had not the Challenger
  disaster happened.

  The "Robot" software is an automatic QSO machine. You connect to the

robot, you are given a serial number, and as soon as you ack the number, the Robot disconnects and enters the QSO into the log. As many as nine simultaneous QSOs can be going on. If the robot hears you, whether or not you make a full two-way QSO, that information is entered into a second log.

You and the world know immediately if you had a QSO or were heard, because periodically the robot sends out beacons. A beacon addressed to QSL> lists the two-way QSO's and the serial number, and a beacon adddressed to QRZ> lists the stations heard.

In addition, the robot has an additional beacon (called the Metabeacon) addressed to QST> which has up to 7 frames of up to 255 characters/frame (i.e. about 1.7 kbytes). This is intended to serve as a longer general information beacon into which Ron can put mission status information.

N2WX and I have worked hard this past weekend to get a "beta" version of the flight TNC software working, and we are ready to test it. The SAREX goodies are now operating from here under the call W3IWI-5 (alias SAREX) on 145.05 using the same radio as the 145.05 W3IWI BBS port. The QST, QSL and QRZ beacons fire every 5 minutes.

Please give the software a shot. Try to crash it! It is a lot better to it die now than in flight!

73, Tom

For this, and any other software that is ROMable, I would be happy to arrange

for a burning for you. I can erase and program EPROMs of just about any size
and will do so for the price of 1$ per ROM if you supply the EPROM and postage
in both directions. This applies to software which has the author's permission
to be ROMd only of course. Since this is such a low fee I hope it will not
engender any flames about commercialism(I don't think I'll be able to make
any profit on this in other words). If you object to this blatant profiteering
keep your comments to yourself :-)

Two BBSs in the UK which are a long way apart and have no good route
between them export their mail to a separate directory, where a small
telephone BBS program can get at it. The mail is then forwarded over the
phone by the other program, and imported back by the PBBS at the other end.
As far as I know this works well, and avoids the need for telephone modem
support in the PBBS program which most people probably won't need.

This version is a combination of Phil's work, from Russell Nelson and PA0GRI.
Phils mods include tracin into a file (trace interface tracelevel [file])
If file is not given output is redirected to the screen.
From Russell Nelson are his mods as contained in diffs.arc.
They include:
a)
Arcnet support where arcnet uses the packet driver interface.
b)
The fcntl control call and command.asm mods. This makes NOS run through when
shell escaping to DOS as a tsr. (no smtp hangs anymore. Even trace goes on)
c)
Interprosess comunication via int 0x2f (for rlogin client)
d)
Logging of MKDir and RMDir commands.
e)
If you have a anonymous account in your ftpusers file any user name will be
accepted and mapped into the anonymous account. (seems not "everybody" knows
anonymous account, In europe guest is used in net/nos often)
f)
The JOINed disk (if used) is found and statused if a dir is done on the joined
drive.
g)
Multiple directorys can be accessed on the same level. Normaly there is a
root directory. In ftpusers it is like "anonymous * /dir1;/dir2 1"
(directorys are separated by ; and no "white space" is alowed.
h)
A net.rc (aka .netrc) file is supported for ftp access to other machines.
This auto logins you to the destined machine.
Format is "system username password" . Note that it all is clear text.
net.rc lives in the root directory.
i)
I did not find the rlogin client so that is not added but some hooks are
in place.
j)

Tar backup feature! If you specify 'recv direct/tar/*.* than all files
in direct are tarred into one destination file. This is great to backup
a single directory into (onto) another system. I did not encounter speed
degradation in backing up my NOS directory onto my UNIX system via ethernet.
On a destination /tar/ read it should expand the tar file again.
a)
From PA0GRI the domain mods are included. (domain 3.2)
b)
autoexec.net is called autoexec.nos to make a difference on people using
both NET and NOS and dont want to switch between configuration files.
c)
A message is given when the default autoexec file is not found.
d)
domain search during autoexec startup is limited to the local machine.
e)
A domain server (series) is tried 4 times before giving up. If a server went
down the probe to it was infinite and the system unusable due to lockup.
(symptom: if typed "route add unknown ax0" the search went on infinite and
only a reboot would give back a promt (whatever type).

I uploaded nosadd.arc and nosgri30.exe to flash.bellcore.com in the files
/pub/nosadd.arc and /pub/nosgri30.exe . nosadd.arc contains all changed files
against nosv30tc.arc (phil's nos.arc 900105)
Also on wb3ffv and gvdgpc bbs systems both files are uploaded.
Note: nosv30 is phil's 900105 release.
Regards. gerard.
(on the nosadd.arc file trace.h and iface.h were missing, sorry.
 They are present now)
(sorry for the mis-spelling of Russell Nelson's name.)

yana:

I have a couple of questions about the HAPN card-TNC (TNC?).

1) Is the software for it in public domain, and if it is,
from where could I obtain the bits? Particularly
sources would be appreciated. What is the postal address
of HAPN?

(I know, I'm greedy.)

2) Does the 8273 do the FCS stuff? Does it send flags (not
just one!) after keying PTT and before actually sending
the frame? What the "standard" TNC is supposed to do in
this time?

3) Does hapn use the p-persistence (persistance?) scheme?

4) And finally: Is there any reason why 89 ka9q doesn't
have hapn-support compiled to net.exe? (Of course I
can always compile it in, but I hate to torture my PC :-).

That's it. I counted 10 question marks. Thanks in advance for any
advice. Happy new decade, from

Huh yourself. In spite of the Subject line, this thread diverged some time ago into a discussion of alternate firmwares for the generic TNC-2. The issue is that the KISS in the combined firmware like 1.1.6 and variants sometimes gives problems, viz: popping out of KISS mode, not responding to 'param ax0 255', etc. Hardware switching of modes adds a degree of robustness, when there is a KISS-only implementation. Another consideration is that there are some KISS-only variants, such as JKISS by G8BPQ, which appear to have some improvements over the standard K3MC release, and piggybacking gives you a way of trying them out.

W0RLI claims to have it (10.3 was the last I saw) and AA4RE again. Of the two, I'd prefer the latter from what I've seen (I ran a PBBS for a couple of years :-).

Incidentally, whatever happened to WA7MBL?

>>the new path?
>
>As has been pointed out here and on tcp-group, WB5BBW@HOU.TX.USA.NA is

I'd not seen this syntax. Is WB5BBW a user and HOU the host? Or is
WB5BBW a host? If so, who's the user?

If HOU.TX.USA.NA is really the name of a location that will accept
mail for people living in the location named, then that's really nice to
have. Neat.

BUT, it's still source routing!

We must recognize the difference between the name of an entity and
the address of an entity. For example kevinr@tandem.com is really only
a name, although it does have some element of source routing in it. Consider
that it should (perhpas) be used only for traffic relating to the business
of my employer. kevin@N6RCE is another name for the same entity, but again
has the same element of source routing in it. I hope never to get anything
but AR related traffic there.

However, you'll note that in neither case, is it really necessary to
specify my geographic location by the originator of the message.
kevin@N6RCE is unique. Adding .norcal.usa.na.planetearth doesn't make it
anymore unique.

However, I agree it would be nice to find out a route to that location.
And the originator may have a good idea. Dan Frnak (WN9K) had a very good

idea along these lines. His suggested syntax is:

user@host [state=CA,bbs=3Yota,nettype=IP]

With the things in [] being optional, and the types of things similiar to
what we have now...

Think about some of the non-electronic mechanisms in use today that are and
aren't source-routing and how well they work.

The US Postal service (and UPS) is source routing. As is the phone company.
Check cashing isn't. How would it do, if every time you gave a check to the
grocery store, you had to tell them how to find your bank to present that
check for payment. The store's bank presents it to the Fed, who looks at the
ABA transit number and finds an adjacency to forward it in the right direction.

If isn't W6XXX.ca.us.na source routing, then W6XXX should be sufficent,
right? Source routing is defined as the originator describing the
path to reach a location.

In the about case, we've tried to "qualify" the name with a path
as well. Yes, I know some would argue that .ca.us.na is a "location",
but how does a location differ from an "address"?

>
>The ham packet network is not a network in the same sense as the

>done. This is a pain in the wazoo..

I agree at the present data rates and physical layer protocols,
connectivity isn't the best, but a number of Hams are working to radically
alter that situation. WHEN that comes about, the nameserver idea will
be practical, and the benefits will be obvious.

PACKET IN AVIATION BAND
By Dave Sweigert

What you hear on 131.55 is packet radio. Aeronautical Radio maintains 200 ground stations around the country that feed into a giant X.25 computer network. Ever wonder where the flight attendant gets arriving gate info minutes before you land ? Via a terminal in the cockpit. Data such as engine tempature, winds aloaft, etc is downlinked via this network. All 200 stations operate on 131.55. For more info write:

Industry Activities
ARINC
Radio Operations, Bldg 2
2551 Riva Road
Annapolis, MD 21403

They may send you some
interesting brocherures.

A few (airline company)freqs which I have tentatively identified:

129.2 American Airlines
129.5 Delta
130.65 Military Airlift Command
130.7 Eastern
129.625 TWA
131.925 Federal Express

Enclosed are some airline company channels used in the Chicago area. Activity can also be heard on ARINC's MAC channel.

Air France/aka Aeronautical Radio, company channel, transportation
[Chicago] _____ 129.0250____KFI9 (others)
Air-Medic One, company channel, medical transportation
[location?]_____ 131.1500____call? (others)
American Airlines/aka Aeronautical Radio, company channel, aircraft maintenance, transportation
[Chicago]_____ 130.2500____KSG7 (B. Parnass)
British Airways/aka Aeronautical Radio, company channel
[Chicago]_____ 131.1000____KFB8 (others)
Delta Airlines/aka Aeronautical Radio, company channel
[Chicago]_____ 129.6000____WCD4 (others)
Eastern Airlines/aka Aeronautical Radio, company channel
[Chicago]_____ 128.8500____KEB5 (others)

We are using telco/uucp to forward between three systems here in the
Little Rock area. I have written a RLI, et all, compatible PBBS on
my Xenix 286 and also interfaced into ka9q's net software.

Forwarding works fine, but the actual transfer is handled by the
mail rather than the PBBS doing the actual calling. Why worry about
functions that are already there.

I also have several users that use uucp mail to send and receive packet
mail through my system. Incoming packet messages are automaticly mailed
via uucp to the destination. Mail coming in via uucp is checked and then
flagged for the PBBS to pick it up and send out via packet. This has
allowed several people to communicate via packet without having access.

Am interested in experimenting more with mail forwarding via uucp to
areas not normally covered easily by normal packet routes.

There has been some confusion about my Digicom cartridge (DIGICART).
The DIGICART replaces the software ONLY. Its advantages include
autobooting and ability to store parameters to the cartridge (both
almost instantaneous). A Digicom modem is still needed for packet
operation. Any questions can be referred to me here or via US mail.

I screwed up; I should have said K5ZC@WB5BBW.TX.USA.NA.
That said, it's STILL a location, not a route. It says nothing at all
except that WB5BBW is in Texas, and nothing at all about how that
message is to get to Texas.

Yes, WB5BBW is unique.
Unfortunately, the only ways to know that WB5BBW is in Texas are 1) have
the user, who knows it already, tell the computer about it; 2) store a
database potentially the size of the Callbook online to look it up; or
3) have the BBS contact a nameserver elsewhere that has the huge
database on it. The nameserver doesn't exist. I haven't seen anyone
volunteering to write it, nor have I seen anyone volunteering to
manually maintain the huge list involved. Until the nameserver exists,
and is the same production quality as the rest of the BBS software, it
won't get used, reducing the available solutions to 1) and 2) above. 1)
is much easier for everyone concerned, and works just fine.

If you have religious objections to what you see as source routing, then
don't complain - come up with the software that will fix it.

I'm running the ka9q software on a unix system w/o tcp/ip support (Sys V).

I'd like to get it to run a outgoing telnet session to a pty port(s)
instead of the console. In other words, I'd like to get the ka9q
software to read and write the telnet i/o to a pty port instead of the
terminal that initiated the session (sort of the reverse of the pty
support already in place). The result would be that I could run
kermit or cu on the other end of the pty and get a login: prompt.

Perhaps it could be generalized to the point where the ka9q session
code wasn't used at all and the systems windowing code (X11 or virtual
consoles) was used for each session.

Any ideas before I start hacking the session code?

  Thought some of this had already been stomped out,
  but I see by the recent comments from n6rce that
  it has not. To take the specific example:
  W6XXX.ca.us.na .. which should actually be
  W6XXX.CA.USA.NA
  The ONLY thing the originator supplies is the
  W6XXX
  The software, using the cached information from
  the global name server, automatically appends
  .CA.USA.NA
  which indeed is a LOCATION, which is USED as if
  it were ROUTING HINTS.

  There ain't no source routing going on here folks.

  Of course, the system is flexible. One COULD supply
  the whole thing as the originator.\

"But wait, there's more!"

The originator probably did NOT supply even the W6XXX.
He probably only supplied the destination USER callsign,
N6ZZZ, and allowed the software to look up that users
host (W6XXX), and that hosts location (CA.USA.NA).

Since we have unique personal addresses, all of this
is possible (now, working), with much more to come later.

"But wait, there's more!"

Once we have such a database (and we have it, NOW),
we could choose to store other things in it. We do.
We store QTH, zip code, handle, and information relating
to the management of the data. Why not store other things?
Simple: no one has asked. We COULD store the users IP
address, for example, and thus be able to look up user
given address or address given user, etc.

The system works. The system is in phase 3 of a 5 phase
development process. The system supports over 10,000
hosts, and over 75,000 users. The system runs in over
100 countries. The system beats the US post office to
all 50 states. Gee ... it ain't perfect. Got a better one?

This is a big win for a lot of sites, but it's worth pointing out that it's
not uncommon for the best location for the switch to be in a different place

than the best location for the local repeater...

>All the rest of it is pretty much off the shelf..

What are you guys using for the up and down converters? We're talking about building something nearly identical here in Colorado Springs, and I'm interested in your choice of RF pieces.

This is done a lot in Japan... mostly with IP nodes, by periodically dialing up a slip link, and doing an 'smtp kick'. The timer functionality added to NET in Japan makes this pretty automatable.

>4) And finally: Is there any reason why 89 ka9q doesn't
>   have hapn-support compiled to net.exe? (Of course I
>   can always compile it in, but I hate to torture my PC :-).

Simple. When I compiled in all of the drivers that were available, the binary got to be *very* large. Since the HAPN (and other) cards are not so popular, it seemed like a good tradeoff to compile in the minimum set that most folks would want, and leave the rest available to anyone willing to recompile...

Particularly given that one person in an area can do the recompile and share the binary with friends, this seemed like a good idea.

  In thinking about this "location" business further, I remain convinced
that is is not "source routing", as a *path* must be specified for true
"source routing". However, on further relection, I *do* see a problem
which could be best expressed as a violation of the principle of
"letting the *network* do the *work*".

  I think what a lot of people are saying is that the *user* should only
have to know the *name* of the entity receiving mail. If W6XXX.NOCAL.USA.NA
suddenly moves to *Maine*, what becomes of mail addressed to the above
address/location ? If the mail were addressed only to W6XXX, it would only
be necessary for the nameservers of the network to be re-educated by
some routing exchange protocol in order for the mail to be correctly
delivered. The user would not need to know of the change.

>
  What we really need to weigh carefully is that in using the "location"
scheme, we are really putting the onus on the user to make up for
inadequacies in the network. Is this a case of pragmatism, or is it
a case of a quick and dirty fix ? I want to think about this some more!

I also am running my own PBBS code under Unix SYSV. I am running KA9Q
as an AX25, Net/Rom and TCP/IP "front end" for my PBBS. The PBBS is
simply an ordinary Unix Process which can be run from either KA9Q,
a local terminal or from the telephone modem. In the "local mode", you
simply run the bbs program as you would any program.. ie; "xobbs w2xo"
would bring up the bbs and identify the user's call. Another system
could call in, bring up the bbs with it's call, and send mail just
as if it were logged in "over the air". By sending the usual "F>" at
the end of the session, reverse forwarding would be initiated and
all mail for the calling bbs would be sent. Of course, the usual Unix
login: and password: gauntlet would have to be passed to get to the
Unix command prompt initially. I have not written anything to initiate
telephone forwarding, as I really hadn't thought of doing this until
I saw N0JCF's article, but it should be pretty straight-forward to
write an litte "daemon" process to do telephone forwarding inititation.

IMHO, it would be a lot easier to do what you want, Chris, with
Unix or Xenix than with DOS, if only so that your system could
answer the phone any time a call came in from another system. This
would be tough to do without multi-tasking, at least.

Incidentally, I also have a UUCP to PBBS mail gateway in both directions
operating as well as a Usenet News function in the PBBS.

I am interested in hearing of anyone else who is doing work
with Unix or Xenix based PBBS systems.

W6ABC@W6ZZZ.SAN.CA.USA is *** NOT *** a source route. It is a
hostname/address ("W6ZZZ") with appended routing hints ("SAN.CA.USA")
which the systems forwarding the message are free to disregard.

The entire problem, in my opinion, is that the string on the right hand
side of the "@" looks like an internet domain address and is therefore
confusing. The idea, method, and semantics of the W0RLI addresses are
not a problem. It is just their appearance.

Someone (Dan Frank?) has suggested altering this to a more X.400-style
of address, something like
     W6ABC@W6ZZZ{city=SAN,state=CA,country=USA}
which preserves PRECISELY the same meaning as the current W0RLI address
string. I have a problem with the verbosity of such an address but the
idea is good. It has the great advantage that parts of a location
(=routing hint) string can be omitted and the rest still parsed quite
easily. (As in X.400, the "city", "state", etc can be abbreviated so
that you don't have type the whole thing.

It would also cause a considerable ripple in the network were we to
convert to Dan's scheme, although the W0RLI BBS software could be
modified to accept either but only emit the {} version, which would
ease the pain of transition. I think it would be an ideal solution for
a network such as the W0RLI BBSs which are hosted on machines too small
to contain a complete routing table for the entire network - and for
which no method exists for disseminating such a routing table even if

one existed.

In the short term, perhaps it would be better to replace either the first or all of the dots (".") in the W0RLI address string with some other character - for example, a virgule ("/"). A W0RLI-to-internet mail gateway could easily parse on that and separate the routing hints from the hostname quite easily. I can even envision such building a routing table from observed BBS traffic, much as Dave Mills suggested in his "wiretap" routing paper a few years ago. Such a routing table would be of great use in going the opposite way in an internet-to-W0RLI mail gateway.

A version of the KA9Q TCP/IP code is available for anonymous FTP from SAYSHELL.UMD.EDU. It is a port of the the NOS 890830 version; as I speak, er, type, I'm doing a port of the NOS 900105 version, which should also be available soon. Look for a file in /pub directory called amiganos.zoo.

This is not a "production" release of the KA9Q code. The code base that I am porting from has not yet been released either, and no documentation has been prepared. I am more interested in having people *test* it, rather than use it as production quality software. Idealy, you should already have some expierence with the NOS code.

The distribution is in ZOO format, and includes all the sources necessary to build it. You will need Lattice C 5.04 to compile it, and a system with a hard disk. On my system (A2000, 1M memory, A2090 controller, medium speed 30MB hard disk), it takes a little over an hour to compile and link all of the modules.

Before anyone asks, no, I can't mail copies of this to people. If you can't FTP it, you're out of luck. The "release" version will likely appear on a Fish Disk and probably also be available from TAPR, along

with the PC version. Don't look for the release version for the Amiga
until after the PC/MSDOS version since that's the porting base.

Move the cavity down into the amateur band by changing the setting on
the tuning screw that protrudes into the cavity. An exsiting rig with
an IF strip tuned to a known frequency (or tunable) is useful here.
Remove any wires going to the Gunn diode, and replace them with a
regulated power supply capable of being modulated. Modulating the power
supply voltage to the Gunn diode will both AM and FM the Gunn diode.
Hook up an IF strip (perhaps with preamplifiers) to the mixer diode in
the cavity. Add a good antenna, get a friend on 3cm, point it at him,
and QSO. Wideband FM is exceptionally easy to get going, and provides
very reasonable performance.

This is addressed directly to PBBS writers particularly and users
in general. Is the requirement still there for each PBBS to add
a message received line (R:)?

While I am not proposing the elimination of being able to trace
a message, I am concerned about the amount of network time this
information is taking. We have all seen mail with 20+ lines of
R:'s and only 5 lines of text. There has been a lot of concern
about routing, but little addressing of the problem once a route
is established - getting it there.

I just took a quick look (using wc and grep) of 383 messages here
on my system. The 383 messages had 11167 lines of text. Of those
11167 lines, 3754 lines were R: tracings. That is 33%. This is
not completely accurate as this assumes all lines are the same
length, which they are not. I would venture to guess that the
average actual text lines are SHORTER than the R: lines, thus
making the percentage of required transmit time higher.

Don't you think this is too much? I, again, can envision the need
for tracing, but a simple callsign would suffice as in reading a
message.

Is the full R: line really required for anything other than ego?

Is reducing to a single string of calls not sufficient to start
a trace if required?

Would it not be nice to have 33% (plus or minus) more time available
for getting actual text across?

Ok, missed that.

>piggybacking gives you a way of trying them out.

Ok. That's valid. I'd do it differently (I swap ROM's in my TNC's routinely
to try out new bits, so it doesn't bother me), but your point is made.

Anders Klemets at SICS has gotten NOS running under sysVr3 using shared memory
and semaphores in such a way that the protocol modules and interface I/O are
separate processes, and you have user commands to do things, ala BSD.

I think his net address is klemets@sics.se, his bits are certainly available
from the machine sics.se with anonymous FTP. Not sure what revs of sysV it is
likely to work under, though.

I think we are arguing over semantics. Call the X6XXX.CA.USA.NA
whatever you wish. In the absence of name servers, we had to do
something. This implementation is working pretty good and getting
better each day as more people start to use it.

When the servers get running to where we can obtain reliable data in a
few seconds, I will be happy consign the .CA.USA.NA to the waste bin.

As far as alternate proposals, where were they when the paper was
blank? The PBBS people have been working on this for over a year.
There are over 20 authors of packet mailbox software on all continents
making coordination of difficult but this is what we came up with.
Now is not the time to start over from ground-zero. If there are
proposals on how to integrate the PBBS addressing with AMPR.ORG, I am
listening.

Oh, noooooo, we fought for years to get the FCC to drop the CW ID requirement
for RTTY operation!!!!!

Seriously, your idea to petition is what was lurking in the back of my mind all
along. I don't care what the regs say, I just want everyone to go by whatever
is in the book so those who do not wish us well can't beat us over the head
with the rule violation issue as part of stealing our bands.

 >>   FINDLEY SPEAKS OUT ON ARF

 >> Paul Findley, author of "They Dare to Speak Out" will be
the guest on the Amateur Radio Forum this Thursday night.
This is a profoundly disturbing book about the influence of
an alien government on the Congress of the United States.

Grubs whines:

>Here we go again - committing hari kiri! This is
broadcasting, not an informational bulletin pertaining to
amateur radio.

Arf says:

This whimpish whining represents all of the intellectual
power of a world class NURD.

There were 15 check-ins, 4 of which were given the
opportunity to ask questions of Mr Findley. One of which
was extremely critical of his position.

Just what on earth does this type of forum have to do with
broadcasting? Do you have any idea of what the word means?
If you want examples listen to W1AW or K1MAN.

Where the hell does it say that ham discussions must pertain
to amateur radio?

> No wonder the FCC gets so disgusted with our lack of
judgment and self-discipline.

ARF says:

No wonder young people are so disgusted with ham radio and
the hobby is falling apart. Nurds like you and your moronic
contests and discussions about rubber duckies are a real
drag.

Do the hobby a favor and say something intelligent on the
air. It might catch on, but I doubt it.

Good luck in the contest,

I have been trying to connect a Kenwood TH215 VHF TCVR to a TNC using

the external mic input and standard connectionc. However, I find that
the standard connections do not seem to work out. What I mean is that
when the whole system is assembled, I cannot get the TCVR to go into
transmit when I send a packet from the computer.

What I'd like to know is what am I doing wrong? Does the Kenwood follow
non standard connections? And if so, what are the correct connections
to the mic and speaker inputs. Unfortunately, I have misplaced my
manual and as a result am stuck.

I would appreciate any help you folks can give me. You can reply directly
to FGHOUSE@UWLAX.BITNET.

Thanks,

!Jim.Grubs@BLOOM-BEACON.MIT.EDU (Jim Grubs) writes:

<previous posting deleted>
<Jim explains his motivations for posting what he does about amateur regs>

>For one very simple reason -- when a few flout the regs, ALL of us suffer
>the consequences. The FCC commonly responds to regulatory abuses in ham

>radio by banning it for everyone. In the past, there was the "Eyebank Net"
>flap, the fallout of which seriously impairs public service projects to
>this very day. The present "20 meter letter" inquiry is a case in point.
>You watch, because of a few scofflaws, we'll lose 3rd party traffic. Because
>of RAIN and ARF, we may lose bulletin transmission.

Let us for a moment assume that you are the source of "TRUTH AND WISDOM"
instead of "ARF", (seems like a territorial dispute to me) what have your
numerous postings of the "you are not allowed to do this, you are not
allowed to do that" type done to prevent your prediction from coming true?
If you think that there is some silent majority out there cheering you on,
then you are sadly mistaken. The only person giving you support is Dube Todd
who was another person that went off trying to say that someone was breaking
the law by asking for military daily use callsigns. He happened to be wrong
but "his heart was in the right place" right? Your postings do more to
harden the resolve of these people than prevent anything. When you make a
person mad, they don't usually go out of their way to re-examine their
beliefs, they get hard headed. So even in the off chance that you are
correct on ANY issue, your postings are NEVER going to accomplish your
stated objective.

>Let's use an analogy -- how long would hobby aviation last if the Sunday
>fliers insisted that their private pilot's license gives them the authority
>to carry passengers who don't "pay" fares but who give presents or free will
>donations? What's the harm? My interpretation of the rules is good enough
>for me, and if I get caught, I'll take my lumps.

Interesting analogy Jim. A Private Pilot ticket allows you to "share" the
expense of a trip with your passengers. You can not be "chartered" to go
someplace (i.e. hired) but you are allowed to accept monetary donations
towards the expense of the trip. So what is the exact amount that you are
allowed to accept? If you tell me that I can only accept 50% of the actual
fuel cost, and I say that I will accept 70% of the fuel cost because I am
also considering the time on the engine towards overhaul, the averaged cost
of avionics repair, the cost of tie downs at the destination, etc., etc.,
then who is right and who is wrong? Neither of us really, since the key to
the issue is that I was going to the destination anyway and I was not
specifically hired or chartered by the passenger to do so ahead of time.
But here is where we get to the root of your postings. YOU have read the
RULES and have gotten a meaning out of them that I didn't get. Who died
and decided that YOUR OPINION or INTERPRETATION is always right? You ALWAYS
come across as being the torch behind all truth and wisdom. If anybody
disagrees with YOU then they are against amateur radio!

>I'm not trying to be a newsgroup nuisance. I'm trying to save my hobby from
>being ruined by a bunch of scofflaws who think doing things by the book
>isn't "now", who think obeying the law is an infringement on their personal
>liberties.

Well I will not comment on being a "newsgroup nuisance". However your
comments on saving YOUR hobby really get to the root of this issue. It
is not YOUR hobby Jim, it is OUR hobby. It is obvious that you think that
amateur radio is a personal possession by many of the things you say and

the postings that you make. The problem is that you just can't convince the rest of us that YOU own it! The problem boils down to the fact that you are deciding what people are "scofflaws", and who is "doing things by the book" and who isn't. You believe that if anyone ever disagrees with your interpretation of a rule, then they are hell bent for leather out to destroy "your" hobby. Do you yell "HI YO SILVER AWAY" before you write a letter for info-hams or packet-radio?

But like ARF, RAIN, DEATH, and TAXES, I will just have to get used to you, since there doesn't seem to be anything I can do about it. Are you mad yet? You are? Then think closely about how willing you are RIGHT NOW to consider whether any of the above is true. Get the point? What you write tends to make people MAD! It rarely makes them THINK, it just makes them MAD, and when that happens the usual goal of the reader is to cause the same effect right back at you. This starts a back and forth flame battle that sometimes goes on for a month or more.. then it finally dies down and then BANGO you write another posting and up goes the FLAME flag again! Do you consider this to be CONSTRUCTIVE?

What you apparently fail to understand Jim is that there is room for more than your personal interpretations of the rules. What you fail to understand is that you could be very wrong on some issues. What you fail to understand is that "your cure" can sometimes be worse than the disease, especially if you happen to be wrong. What you fail to understand is that disagreeing with you is not a DEFACTO rebellion against law and order!

I guess simply said Jim, YOU JUST FAIL TO UNDERSTAND..... PERIOD!

I share your distaste for the half-baked idea of going back to Baudot, as
presented in the QEX article you're referring to. There were a lot of other
things in the article that bothered me too... so much so that a couple of
weeks ago I submitted a followup article to QEX which outlines what I feel
are some better alternatives. Strangely enough, one of them was to use
LZW compression! :-)

The PK-232 manual has a diagram showing exactly how to do this. Audio
in (to PK232) connects to the earphone jack and audio out connects to
the mic jack. PTT is connected to the mic jack through a resistor. I
did exactly what it said and it works fine.

...
i've compiled the 890421 version of netpc with turbo-c 2.0. most
everything seems to work ok except for the "mbox" command. i can
enable this option with "mbox yes" -- but when friends connect,
if they don't hit the options just right, they get caught in an
error loop with no way out (falls through to the "huh?" default).

if they get so far as to input a message, the "/ex" or "ctl-z"
options will not terminate the message. all they can do is to
disconnect. this also occurs via netrom connects.

is this code just quirky, or am i doing something wrong -- or has
anyone compiled and used this code with turbo-c 2.0?

thanks...

OM,

I only received the subject in your mail message, but I assume you are
trying to use the FT-727 for packet.

Get a 5k potentiometer and an audio transformer (1:1); I got both from
Radio Shack for about $5 total. I've misplaced the schematic, but will try
to give sufficient info by looking at my connections.

The earphone plug ground gets connected to the shield from the din plug cable.
The black lead from the cable goes to the ear plug center.
I sheared the red lead
from the cable - it goes nowhere. (This is a cable from the MFJ 1278.)
The yellow lead from the cable is connected to the center lead from the
pot. The white lead from the cable is connected the primary of the audio
isolation transformer. The other primary connects to the center of the
mike connector.   Each of the secondary leads connects to one of the
outside pot connectors. Finally, connect the most clockwise pot lead also
to the the grounds of both the mike and earphone connectors.

You will have to adjust the pot, but it works for a wide range. Also, of
course, have the squelch off and gain at about half.

Make a racket! 73s de Bob, N7JKV

Here is a schematic (using the term broadly) that I found in my directory
-- between this and the other response, you should be able to make it work.
Others have:

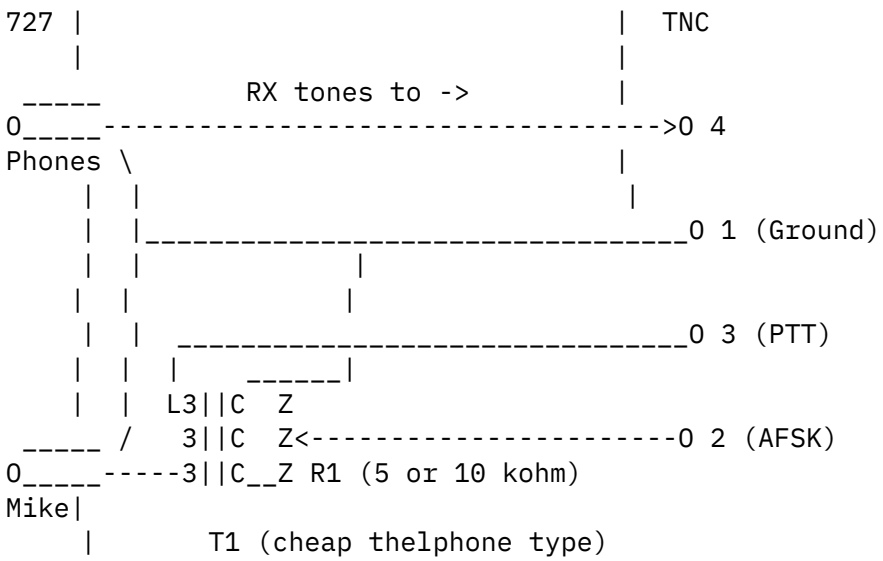
I use the FT-727 with a 1278 on packet. Here is the scoop:

The TNC has 4 lines out:

1. Ground
2. AFSK - out
3. PTT
4. Receive tones in

The audio is superimposed on the key line.

T1 in the following diagram is a miniature line transformer - about 3/4
inch cube. 600 ohm to 600 ohm, or anything that works.



73s and good packeting

I guess most of us don't exactly know what's a violation of the rules
if we'd deal with compression.

So I talked to the official in charge of our FTZ (german version of FCC,
relates to governmental's department) and asked for some interpretation.
I was told the main aspect is a simple way of verification to make shure
that amateur-PR isn't abused for commercial purposes. I'd say this is our
interest too, isn't it ?|
He said a compression scheme which could be decompressed by means of
a TNC's special monitoring feature would be acceptable.

This means compression should be done in the TNC firmware (layer 2
function) instead of e.g. the BBS programm.

Some hams expressing their opinions on pr-digest seem to treat it
as a pure US institution. Anyway it is in fact spreaded all over Europe.
I know it's been read in Japan, Australia, and some regions of Asia too.
So it would be interesting to see what the regulations in other countries
look alike.

So I'd appreciate some kind of a summary what the regulations concerning
compression are in the different countries.
Sometime we'll forward compressed files across the borders and it
would be silly to get a

  REJECT BECAUSE OF LEGAL RESTRICTIONS

 Sb: How/When To Use Packet Beacons

PACKET BID: 7676_N6IIU
WHEN TO USE A BEACON
by Travis A. Wise, KB8FOU

INTRODUCTION

I have noticed a lot of "informative" packets lately telling hams how to do this and when to do that. I guess this is just another one of those packets, but I hope that some of you will read it carefully and understand what information I am trying to convey to you.

WHAT IS A BEACON?

Beacons are sent in UI (Unnumbered Information) frames. The purpose of the beacon function is to announce that your station is on the air. Sending beacons on congested frequencies is poor operating practice, not to mention the fact that it can annoy stations monitoring and help clog the frequency.

WHAT ABOUT DIGIPEATERS?

Sometimes, there is an unmanned station that is on the same frequency all the time (usually on the same frequency as a popular PBBS). Often times these stations are owned by the local city radio club. These stations probably have beacons announcing the fact that they are

available to be digipeated through. ANY station can be used as a digipeater, and most of the time, where there is a popular PBBS, there is a ham or two that monitors the frequency full time, and can be used as a digipeater. Oh, one other thing, if you have to use a digipeater to get into a PBBS, you might want to look for another PBBS to use. For those of you who are the control operators for these unmanned digipeaters, please stop the beacon and leave a message on the PBBS periodically letting the hams know that you are available to be digipeated through. If a beacon has to be used, DO NOT set the "unproto" feature to "CQ". Set it to either "beacon" or "id", but definitely not "CQ". Setting the unproto to "beacon" or "id" can have it's advantages. Many newer TNCs have a feature which will not monitor packets addressed to "beacon" or "id". This can be useful for stations who know about the digipeaters and do not need to be bothered by their beacons.

73 and Merry
Christmas,
Travis

I have been resisting, but keep getting *many* requests to implement a 'compatible' mail service under DOSGATE. I do provide as an example of simple applications a very *CRUDE* mail system with my DOSGATE package. 'Compatible' is supposed to mean compatible with the many AX.25 autoforwarding mail BBS's that are out there.

I would like to not re-invent the wheel again (I know, if we didn't re-invent the wheel every so-often, we still would all be driving around on square wheels ;-)), so....

I don't have enough time to investigate and learn the ins and outs of all the rules for forwarding email using these 'RLI, 'MBL things...

Are there any email implementers out there who are familiar with the packet (AX.25) scheme of autofowarding and reception of email???

Would you like to develop the email package for use under DOSGATE, or port an existing package???

This could be done in stages, maybe first only allowing incoming mail, and possibly in a later revision allow outgoing mail.

Simple DOSGATE programmer's rules:

1) Only MS-DOS int 21h function calls for I/O to the user (no BIOS int 10h/16h I/O and no direct video output, limit character set to the standard 7 bit ASCII characters).

2) Don't mess with the serial ports (all remote users are considered to be on the CON: device).

My example mail utilities consist of a few stand-alone .EXE programs that use a few environment variables and share a few *simple* files:

environment variables:

USER= <- callsign of connected user (could have path, and date/time)
ie: USER=NM1D-15 via KA1EGF [12/18/89 13:30]

MSG= <- directory where mail data files are stored
ie: MSG=C:\MAILDIR

SYSTEM= <- name of DOSGATE system, for identifying info for email
ie: SYSTEM=NM1D DOSGATE, DERRY, NH 03038

executeable files:

LIST.EXE Lists mail files (similar to 'L' command in BBS's)
ie: LIST (list all mail to ALL, or TO or FROM 'USER')

SEND.EXE Sends mail to a user (similar to 'S' command in BBS's)
ie: SEND NM1D to send mail to 'NM1D'

READ.EXE Reads mail addressed to a user (similar to 'R' command in BBS's)
ie: READ #, or READ NM1D to read mail addressed to 'NM1D'

additionally, this command is invoked with the '/c' switch
to check if there is any mail for the current 'USER' when
the user first connects. This is to inform user of pending mail.

I was going to have 'READ /C' also check the current 'USER'
callsign, and if it belonged to a BBS that is listed in a
special file, then spawn the program that will handle the
interface with the automatic BBS's.

KILL.EXE Deletes mail (similar to 'K' command in BBS's)
ie: KILL #

Also, if anyone is interested in developing other packages for use under DOSGATE, please let me know, and I will help you as I can.

Thanks, Rich

I just read in the latest 73 magazine an article about usenet. In this
a sidebar said something to the effect that the folks who run internet were
planning to connect a ham packet network called AMRNET. If I read this
correctly, domain addresses would be used by packet stations just like any
other internet node. Does anyone out there have knowledge of this? Thanks,

Steve Look KA9SZW

Here it is!

[24590] B   BID: 5119_W1NY
Path: VE3JF!WA2SPL!WA2UMX!K1MEA!N1GJH!W1NY
Date: 21 May 89 04:11:34 Z
From: NQ1C@W1NY
To: ALL@ALLBBS
Subject: QSLMGR Server @ W1NY

I have placed the QSLMGR server online at the W1NY BBS. This server will keep a database of QSL managers, and requests from users for QSL managers. You can submit a request to the server asking for a particular station's QSL manager, and the server will return a message to you with the information. If the server does not know the QSL manager for the station you request, it will file your request and send you a message if it does find out.

To learn more about the server, you should submit a HELP request to it. Send

a message to QSLMGR @ W1NY. The subject of the message is ignored by the server

so you may put whatever you like. In the body of the message, simply put the word help. If you'd like to see what a sample session of sending a message to the server might look like, submit your message with the word sample rather than help.

If you have any questions or comments about the server, I'd love to hear them! Input is always welcome.

- Bob, NQ1C   Sysop @ W1NY

Path: VE3JF!WA2SPL!W1NY
Date: 13 Nov 89 14:27:56 Z
From: NQ1C@W1NY
To: VE3RMM
Subject: QSLMGR Response

QSLMGR (QSL Manager Server) version 1.3 is running on 12-Nov-89 at 19:40
(c) Copyright 1989 Bob Lafleur, NQ1C @ W1NY

*** Please send your requests to QSLMGR as Private messages, not Bulletins!

[sample]
A typical session for submitting a request might look like this:

```
k1mea bbs>
SP QSLMGR @ W1NY
subject:
QSL REQUEST
message:
```

```
V47RF
SM5BRW
<control-Z>
message 14000 stored.
```

In this example, a request for the QSL managers for the stations V47RF and SM5BRW has been submitted to the server. An update request might look like this:

```
k1mea bbs>
SP QSLMGR @ W1NY
subject:
QSL UPDATE
message:
UPDATE
A22WZ OE3NH
V47RF WA2SPL
W200NY KA1KPH BOX 17, Feeding Hills MA 01030

<control-Z>
message 14001 stored.
```

This request will add A22WZ to the database with the QSL manager of OE3NH, V47RF with WA2SPL, and W200NY with KA1KPH's address.

```
k1mea bbs>
SP QSLMGR @ W1NY
subject:
REQUEST
message:
DUMP
<control-Z>
message 14002 stored.
```

The above will cause the server to return a list of all the routes that you have requested which were not fulfilled by the server.

The following example shows how you can do multiple commands with one request. Any command that takes a list of callsigns will recognize a blank line to mean the end of the command. The following example illustrates removing calls from the database and adding new calls to the database all in one server request.

```
k1mea bbs>
SP QSLMGR @ W1NY
subject:
INFO UPDATE
message:
DELETE
A22WZ
A24EE
                              (blank line ends delete section)
UPDATE
```

```
     V47RF WA2SPL
     <control-Z>
     message 14003 stored.

   Any questions, comments, or problems about the QSL Manager Server
may be directed to NQ1C @ W1NY.

[ There are 391 pending requests. ]
[ There are 6290 entries in the database ]

I have available a mailer system to run with NOS (KA9Q).  This mailer
is a substitute for BM.EXE

It is a full screen mailer that allows you to scroll up/down through the
headers then hit enter to read the message.  You can use your own editor
to view or send email.  It is still work in progress, however, I think
it is stable enough for some other people to give it a try.

Great for ready info-hams mail ( It can separate messages from a digest )

So give it a try, and let me know if it blows up on you.

FTP 129.100.22.100
user: anonymous
pass: use your email id
binary
cd view
get view.exe
```

Also you may want to grab qe.exe (editor)
and list.com (reader) or use your own. Some docs to follow by friday.

Comparing notes in that fashion always in determining a common standard to
present to the various administrations.

The thing that blows my mind is that many here seem to take delight in twisting
my original question into something totally different than I intended. My

original question was, paraphrased, "What is the legal status of a compression scheme that produces symbols that aren't in the alaphabet we're allowed to use on HF?" Even more peculiar is the fact that when someone else asked a similar question a few months ago, it went virtually unnoticed.

In my PK232 manual, instructions for interfacing to the IC2AT are
on page K-1 (appendix K).

It is a little weird. It is like the interface to the Yaesu
FT727 and FT-x03 and FT-x09.

The PTT and GND on the PK232 are connected TOGETHER (!?) and run
thru a 30K resistor to the tip of the mic connector. The tip is
also connected thru a .1 uf cap to the AFSK connection on the
PK232 (TX Audio). The tip side of the receive audio goes to the
RX audio connection on the PK232.

The IC2AT may have some timing problems due to slow switching. Play
with TXDelay on the PK232. I know one ham with an IC02at who never
could get his timing set to communicate with the local node.

(I'm posting this for Steve Stroh N8GNJ who, at the moment, can read this newsgroup, but has difficulty in posting to it. For a direct response, send replies via packet to N8GNJ @ KD7NM.WA.USA.NA)

The Northwest Amateur Packet Radio Association (NAPRA) is the Seattle area packet group. NAPRA is building a full duplex regenerative package for our 145.01 wide area user node, and we would like to get in touch with other groups in the country who have built similar systems.

Specifically, our package would receive on 145.61, and transmit on 145.01. It would digitally regenerate all received packets (no voice could pass through), and allow access to a Net/Rom node.

The primary reason for doing this is that the 145.01 node is located on one of the highest peaks in Western Washington and has excellent coverage. We encourage users to connect to the node, and then connect to their contact, and the node will act as a "traffic cop" and allow fair access to all users of the frequency. Unfortunately, many users ignore our pleas, and the result is, predictably, a mess. Connecting to the node seems to be too much "trouble" for some, and we felt that the full duplex system would provide for those persons who want to work "direct" and also allow the channel to be used by those desiring BBS and network access too.

Our technical group would like to hear from other groups who've done what we're planning to do, or are thinking about it. Replies posted to the newsgroup are preferred with group names,

mailing addresses (U.S. Snail- sorry), and phone numbers of
contacts.

Thanks very much!

>-Henry

I was thinking the same thing, Henry. At one time, I had dreams
about setting up a packet <-> internet gateway, forwarding email
for AX.25 and supporting ftp for those lucky enough to have TCP/IP.

FTP and TCP/IP is no problem, since I would only let it be accessible
from the packet side, but I'd have to look at every single piece of
EMAIL and put my callsign on it, and handle it (basically) third
party. The other alternative would be to let email originating from
someone I know is a licensed amateur through, in which case they
would be in "remote control" of my station (perfectly legal) - problem
there is that then the guy who is this remote control operator
then has to follow the part 97 rules about providing reasonable
security about non-licensed people activating the system. (i.e.
can't walk away from your terminal, etc.)

Interesting issue.

Merry Christmas! Having some idle time before the holiday vacation, I
figured I'd package up my current set of patches for Phil Karn's
TCP/IP package, NOS. These patches are for the next-most recent
version of NOS, 890918. If anyone adapts these for the most recent
version, I'd like a copy. Both the patches and that version of NOS
and a version of patch for the PC are available on
sun.soe.clarkson.edu's pub/ka9q directory. Also available from
archive-server at same host. Filenames:

```
diffs.arc
src.arc
patch.arc

In short, we've got:

ARCNET.DIF     ARCnet support.
EXTERN.DIF     External access to NOS.
FCNTL.DIF      Adds fcntl()
FTPSERV.DIF    Minor fixed to the ftp server
JOIN.DIF       For people who JOIN their drives
NETRC.DIF      Adds a .netrc capability
RLOGIN.DIF     Adds a rlogin client
TAR.DIF        Adds a tarfile disk backup.

What is needed to put up a TCP/IP node (hardware/software)?
Does a computer need to be hooked up or on all the time
for this? We have a remote site with limited access and power
so PC is kind of hard to find room for.

What is TeXNet and where can I get information on it?

After many requests for access to DOSGATE via ftp, etc... I have uploaded
it to the SIMTEL20 server. Keith was gracious enough to make it available

to all who want it.

You want the following file:

pd1:<msdos.packet>dosgt114.zip

This is the latest DOSGATE (version 1.14), it fixes problems with the previous release and allows it to be used with many more TNC's.

This release also fixes a problem that kept DOSGATE from working without a TNC (ie, when trying to user a remote ASCII terminal).

What does DOSGATE do? It allows remote use of your PC via packet radio or a remote terminal via modem or RS-232. This means you can run *almost* any MS-DOS software that you could conceive... "*almost*", because, DOSGATE is designed so that the remote user is NOT required to have any special software of ANY kind... therefore, any programs that use graphics, color, or don't interface with MS-DOS via INT 21H for console I/O should not be considered DOSGATE compatible.

I won't bore the net (again) with the list of applications that I have running on my DOSGATE system in Derry, NH (NM1D-2, nearest node SNH).

DOSGATE is also available via telephone modem on the following BBS's:

 K4NGC (703) 680-5970
KA1MGO (508) 688-1348

 Sb: Hierarchical addresses, how to use.

  PACKET BID: 26307_W3IWI

  More and more of the BBSs are now supporting "H" Hierarchical addresses
  of the form   K9DOG @ W3IWI.MD.USA -- you can tell which BBSs accept
  such addresses when you connect by looking at the SID = System ID.
  This is the field like [MBL-5.13-H$] or RLI-11.6-CH$] where the H indicates
  that the BBS accepts the expanded addresses.

  Now for some "rules":

  (1) In the portion to the right of the "@" you still must supply a valid BBS
  call if you use "H" addressing. You do not use "H" addressing for NTS msgs
  (i.e. ST 94321 @ NTSCA) or for bulletins (i.e. SB ALL @ MDCBBS $). You
  don't have to use the "H" addressing for well-known BBSs (i.e. mail sent
  like SP W0RRY @ K0JJV) still works just fine.

  (2) The fields to the right of the @ which are separated by periods are
  intended to be real, physical LOCATIONS. The convention that is being
  followed is to use the two-letter state/province postal abbreviation.
  Examples in the USA & Canada include:

  Maryland MD
  Quebec   PQ
  Michigan MI
  Washington (state) WA
  Wash.DC   DC

  and similar definitions in foreign countries:
  the Milano district of Italy MI
  the state of Western Australia WA

  (3) This is followed by a three letter country abbreviation following ISO
  standards -- these are the same as the letter codes you saw during the
  Olympics. Examples are:

  Argentina   ARG
  Australia   AUS
  Austria   AUT
  Brazil   BRA
  Canada   CAN
  Chile   CHL
  West Germany DEU
  Greece   GRC
  Indonesia   IDN
  Israel   ISR

```
Italy         ITA
Japan         JPN
South Africa  ZAF
Spain         ESP
Sweden        SWE
Switzerland   CHE
England       GBR
United States USA
USSR          SUN
etc.
```

(4) To this may be added an optional continent code like EU=Europe, NA=North America, AS=Asia, AU=Australia.

(5) Addresses are assembled from left to right, smallest area to largest. Thus my full address would be W3IWI@W3IWI.MD.USA.NA but for forwarding within this continent, W3IWI@W3IWI.MD or W3IWI.MD.USA would be adequate. From the examples given above, you must be careful for mail leaving the country since .MI could be either Michigan or Milano. Thus I would need to address a message to my friend Luca in Milano like IW2ECL@I2KBD.MI.ITA or IW2ECL@I2KBD.MI.ITA.EU to avoid the message going to Michigan.

(6) In some cases you will see an attempt to facilitate local distribution with an address like W6XYZ@N6VV.#NOCAL.CA.USA where the #NOCAL may mean something in California but is just passed thru by BBSs forwarding the mail out west. Such supplementary addresses are ALWAYS preceeded by a #. Don't try to be creative inventing new ones. A bad example is one user who invented the return address xxxxx@N4QQ.MDCBBS.MD.USA.Z:21211 -- both the MDCBBS and Z:21211 fields are bogus.

(7) Don't use these addresses to try to force routing. A recent message sent to Washington state with the address xxxxx@WS7M.W3IWI played ping-pong for three days between the W3IWI and WB7DCH HF mail gateways.

(8) The extended "H" address applies to the BBS -- not to the individual user. Thus if K9DOG uses W3IWI, then his address is K9DOG@W3IWI.MD.USA, not K9DOG.MD.USA . The address for a Virginia user of WA3ZNW is N4PQR@WA3ZNW.MD.USA and not N4PQR@WA3ZNW.VA.USA since ZNW is located in MD.

(9) Remember that you need to supply a correct ADDRESS for mail. You should not worry about the route the mail takes. Don't try to force your mail to follow a particular path.

(10) It is your responsibility to supply a good, clean, correct address and the packet network will do its best to move the mail to its destination. Be careful about typographical errors. Here are some examples of what has happened: N0AN is not the same as NOAN (with the letter o). W1XYZ is not WIXYZ (with the letter i) nor is it WlXYZ (with a lower case L).

Hope these hints help -- 73 & Seasons Greetings de Tom, W3IWI

Yes, I am sure we can. Read on.

>From: Perry Scott KF0CA
> I recall passages in the FCC regs about having the key available at your
> station for decrypting, and making it available upon request from the FCC.
> Maybe that was back in 1975 and the rules have changed.

You should have a copy of the new rules. I'll supply a copy of the sections
that affects this discussion:

[bracketed sections by ka9wgn, skipped section for brevity, read your copy]
begin FCC rule quote {
97.307 Emission standards.
    (a)-(e) ...[various emission standards rules skipped]
    (f) The following standards and limitations apply to transmission on the
  frequencies specified in 97.305(c) of this Part.
[see 97.305(c) for which paragraphs apply to which subbands]
[be sure to see Sept 27 corrections as June 20 version had many errors]
    (1) ...[section on angle modulation skipped]
    (2) [note this paragraph does not apply (due to 97.305(c)) to RTTY and
  data emissions, except on 160m] No non-phone emission shall exceed the
  bandwidth of a communications quality phone emission of the same modulation
  type. The total bandwidth of an independent sideband emission (having B as

the first symbol), or a multiplexed image and phone emission, shall not exceed that of a communications quality A3E emission.

(3) [160-12m] Only a RTTY or date [note, "date" spelling error has NOT been corrected by FCC] emission using a specified digital code listed in 97.309(a) of this Part may be transmitted. The symbol rate must not exceed 300 bauds, or for frequency-shift keying, the frequency shift between mark and space must not exceed 1 kHz.

(4) [28.0-28.3 Mhz] Only a RTTY or data emission using a specified digital code listed in 97.309(a) of this Part may be transmitted. The symbol rate must not exceed 1200 baunds, or for frequency-shift keying, the frequency shift between mark and space must not exceed 1 kHz.

(5) [6m,2m][125cm was erroneously applied in the June 20 version, but has been deleted (see 6) in the Sept 27 version] A RTTY, data or multiplexed emission using a specified digital code listed in 97.309(a) of this Part may be transmitted. The symbol rate must not exceed 19.6 [not 19.2] kilobauds. A RTTY, data or multiplexed emission using an unspecified digital code under the limitations listed in 97.309(b) of this Part may also be transmitted. The authorized bandwidth is 20 kHz.

(6) [125cm,70cm] A RTTY, data or multiplexed emission using a specified digital code listed in 97.309(a) of this Part may be transmitted. The symbol rate must not exceed 56 kilobauds. A RTTY, data or multiplexed emission using an unspecified digital code under the limitations listed in 97.309(b) of this Part also may be transmitted. The authorized bandwidth is 100 kHz.

(7) [33cm and shorter] A RTTY, data or multiplexed emission using a specified digital code listed in 97.309(a) of this Part or an unspecified digital code under the limitations listed in 97.309(b) of this Part may be transmitted.

97.309 RTTY and digital emission codes.

(a)(1)-(3) ...[sections listing specific codes skipped]

(b) Where authorized by 97.305(c) [authorized emission types] and 97.307(f) [bandwidth and baudrate limitations] of this Part, a station may transmit a RTTY or data emission using an unspecified digital code, except to a station in a country with which the United States does not have an agreement permitting the code to be used. RTTY and data emissions using unspecified digital codes must not be transmitted for the purpose of obscuring the meaning of any communication. When deemed necessary by an EIC to assure compliance with the FCC Rules, a station must:

(1) Cease the transmission using the unspecified digital code;

(2) Restrict transmissions of any digital code to the extent instructed;

(3) Maintain a record, convertible to the original information, of all digital communications transmitted.

} end FCC rule quote

My analysis of this tells me that I can use any code I wish to use provided that:

(1) I use 6 meters and above for the transmission, limit my bandwidth to 20 khz on 6m and 2m and to 100 khz on 125cm and 70cm. If I use one of the codes listed in 97.309(a) w/o the limitations in 97.309(b) then I must adhere to the baudrate limitations of 300 (160-12m), 1200 (10m), 19600 (6m,2m) or 56000 (125cm,70cm) baud unless I operate on 33cm or shorter. I do not need to limit my bandwidth on 33cm or shorter.

(2) I do not use it to communicate with any foreign country with which the United States does not have an actual agreement in place to allow

the particular code I want to use. I suppose it might be possible for the US to negotiate an agreement allowing ANY code. There should be a list of such countries and what codes are agreed upon for each.

(3) I may not use the code for the purpose of obscuring the meaning. This certainly includes an cypher for which the algorithm and key are not publicly known. Also, if I happen to believe that someone is not capable of receiving any certain particular code and I switch to using that code so he cannot copy my transmission, even though it might be a publicly known code, then I have fallen under the "for the purpose of obscuring the meaning" clause. This is a matter of INTENT and brings with it all the legal vagaries associated with proving intent.

(4) The Engineer In Charge can direct any combination of the listed requirements on my station (not me, the operator). The third requirement is to maintain a record of what was transmitted (not just what code was used). I am not required to keep this record unless directed to do so by the EIC. Note that by the LETTER of this rule, the EIC can require such a record of ALL digital communications, not just the ones using an uspecified code. While the spirit is apparent to me to be applied to only unspecified codes, I see this as a minor gap in the rules that needs a bit of touching up (petition for rulemaking?).

Further rule nitpicking suggests to me that (in 97.307(f)(3)-(5) applicable to HF frequencies) that EITHER the baudrate limitation applies OR the frequency-shift limitation applies due to the use of the word "or" in the rule text. Since 97.307(f)(2) does not apply to RTTY and data emissions (except in 160m) according to 97.305(c), apparently no bandwidth limitations apply either. So if I have a high baud rate of one of the specified codes, along with the use of frequency shift keying of 1 khz or less, on HF, then the bandwidth will not matter (as no rule paragraphs apply). I believe we call things like this "loopholes". Another petition?

>From: Perry Scott KF0CA
> I think one of the contributions of Amatuer Radio in this area is to squeeze
> more out of RF data networks. So, it is within our charter to request the
> FCC to relax the cipher rule so it doesn't apply to simple compression for
> transmission purposes.

It seems to me, after reading over the rules rather closely, that they are in fact suitable to begin experimentation. Compression codes such as the LZW code fall under the "unspecified" codes and I find them usable within the limitations of 97.305(c), 97.307(f)(5)-(7) and 97.309(b). That rules out using them on HF.

I also believe that I may use checksum and Forward Error Correction codes, as they do not obscure meanings at all where they do not alter the original data. They may still fall under the definition of "unspecified" codes by the LETTER of the rules, which may worry some regarding their use on HF to enhance the reliability of that spectrum. Another petition for rulemaking could clarify this by allowing the appendage of checking, correcting, and authentication codes to the clear data being sent for all specified (and unspecified) codes.

Don't confuse these addresses with valid Internet domain names. They're
really geographic-based hierarchical routes.

These just LOOK like valid Internet domain names, but they aren't, of
course, since hams had to invent their own standard instead of using a
real one.

One more giant step backwards for ham radio.   Rah rah rli.

Remember my comment about production systems versus neat hacks?

There wasn't production-quality code available...so hams took what they
had and made it work. It's not nice and pretty, but it does work.

Don't like it? Come up with a production system that does it the "right"
way.

>can not use 'normal' tnc2 roms. I have a programmer to burn the chip.
>Is it available for FTP somewhere?

Two responses:

1) Call Heath customer support and complain loudly that they don't ship KISS
    support. It's available for the Tasco variant in Japan, and it's in enough
    demand in the US that they ought to make it available.

Meanwhile...

2) Look on col.hp.com in ~ftp/ka9q/etc for the file u21_kiss.rom, which is a
    binary image of a 27256 I got from Japan via a friend at Cisco, that is
    the normal firmware with KISS support included. I just go through the
    auto-baud routine, then type 'kiss on' followed by 'restart', and it's
    in KISS mode until you cycle power on the TNC.

What in the world does a concept of production-quality code have to do with
following standards? Even the worst hack software may make an attempt at
following an established, published standard. If I may rephrase Mr. Kantor's
statement into a question...

Why didn't the they/them/it/fill-in-the-blank follow available standards?
There may indeed be valid reasons for deviation from a standard. The
fact that someone other programmer didn't supply "production-quality"
completed code implementing a standard isn't one of them.

After all, what fun is a project if someone else has already done the same
thing. (Let's leave out the profit motive in this one.)

The standard Brian wants the ham world to follow so badly differs from
what the hams implemented in one important respect: What the hams did
doesn't require a name server to function, while the Internet
hierarchical naming system depends strongly on having one available.

Where's the name server? Well, all of the code that can use one - none
of it production-quality, and all of it still highly experimental
according to the author - does not include a server function, but
instead points the user to an existing server, or else the user is
stuck. This matters little to the religious, though.

The ham solution was implemented because the authors wanted a scheme
that would work, now, instead of waiting for the ideal solution to
spring up magically. It may not be theoretically pure, but it works.

>itself out of KISS mode at irregular intervals.

This has been reported elsewhere... it's not just you.

>Someone please correct me if I'm wrong, but I believe that electrically
>all TNC-2 are identical. Would this mean that I could purchase an EPROM
>for another manufacturer's model?

I'm under the (unsubstantiated) impression that the 1278 is a sufficient
departure from the TNC-2 design that using TNC-2 firmware is apt to be a
disappointment.

Thought of trying the novel approach of calling MFJ's product support and
asking if they have a fix? If not, lean on them to figure it out and fix it...

>One could use an HT for packet radio; the main problem would be the
>typical HT's limited power.

My experience is that if you think you need more power than an HT, then you ought to be spending your money somewhere else... like antennas. Putting a whip on the back of a mobile rig in the basement is liable to inject more RF into your computer and TNC gear (a lot of TNC's PTT circuits will lock up if you goose them real hard... the FET saturates, I think) than towards your local digi/switch. It *really* pays to invest in an outside antenna and some coax. Even a coat-hanger 1/2wave groundplane built on an SO-239 connector outside your window is a big win over a rubber duck...

>1. What's this WA4DSY modem I hear so much about?

The 56kb MSK modem design that is being distributed in kit from by GRAPES. Doug Drye KD4NC recently posted contact info to this group.

>2. How much interest is there in using TCP/IP?

Extremely widespread, and growing. I recently returned from Japan, where there are over 100 TCP/IP stations on the air. There is heavy usage in northern California, and in New England, and steadily increasing usage in other parts of the country.

>3. How does a packet node get to be an Internet node? Do a couple of guys
>   wearing tool belts and hard hats show up on your doorstep dragging a
>   long blue cable?

Technically, that's about it. In reality, you don't. There are organizational and political problems to be overcome before there is direct IP level connectivity between the amateur Internet and the "real" Internet on a widespread basis. Mail relays exist in several places, in relatively undocumented form, however.

>4. Does anybody have any information about the Gunnplexer application?

Read the December issue of Ham Radio magazine, an article by N6GN and N6RCE, for all the gory details.

>5. I am still curious to know if schematics for TNC's are available, or
>   if some TNC designs are in the public domain.

Why?

Seriously, building a TNC is a waste of effort, given the pricing of existing TNC's and PC plug-in cards. If you're still not convinced, start with the ARRL Computer Networking Conference proceedings... buying the entire set would be a reasonable investment in information...

>What is needed to put up a TCP/IP node (hardware/software)?
>Does a computer need to be hooked up or on all the time
>for this? We have a remote site with limited access and power
>so PC is kind of hard to find room for.

For now, the best solution is something like a PC clone with DRSI or Paccomm cards in it. Soon, you should be able to buy the PS-186 from AEA, the de-40 (or whatever it's called this week) from Kantronics, or the Awesome I/O card from DRSI/K3MC, all of which will eventually run standalone packet-switch versions of the NOS code.

>What is TeXNet and where can I get information on it?

It's a name that describes a complete networking system, including z80-based hardware, 9600 and 1200 baud modems, and software for the z80 boards that is being used in much of Texas, and some other areas. It is neat if you are only interested in the set of services provided, but is deficient for a lot of folks because it's non-trivial, if at all possible, to use Texnet backbones to run IP, et al.

The group to contact is TPRS, the Texas Packet Radio Society. I don't have contact info handy, but Greg Jones WD5IVD is a reasonable person to start with. He shows up at most of the packet conferences and talks Texnet until he's blue in the face... :-)

>Remember my comment about production systems versus neat hacks?

Yes, vividly.

>There wasn't production-quality code available...so hams took what they
>had and made it work. It's not nice and pretty, but it does work.

Aren't you walking both sides of the fence? You condemn hacks because you want production systems, but you condone hacks because "production-quality code" wasn't available? Am I allowed to ask you to make up your mind? :-)

>Don't like it? Come up with a production system that does it the "right"
>way.

This is an unrealistic request. I think Brian is being a bit harsh, but in the long run, he's right. It would have been *so* much better for the creative energy that has been expended inventing the HF routing scheme and putting it to use to have been focussed on, say, building better automated routing mechanisms for NET.

The ham radio community, and the packet radio neighborhood, are far too small for us to be able to afford fragmentation and survive. We ought to be working on how to work together, instead of pissing on each other...

I grabbed the net-unix.cpio.Z file from vax.cs.pitt.edu and could email
a uuencoded copy in a few pieces if I get requests within the time period
it does not get removed from /tmp.

Alternatively I could copy files to 720K or 1440K 3.5 inch IBM PC disks if
you send one in a self-addressed-stamped-diskette-mailer (inside another
envelope).

Sorry, I could not get to col.hp.com. I got the connection but the FTP
server was so slow to answer I gave up. Maybe Bdale can mail you those
files some way.

Does the United States have an agreement with Canada allowing the use of
unspecified codes, or specifically the LZW compression code, between the
two countries? Does anyone really know?

Of course if you read my recent analysis of the FCC rules, you will note
that I have found the rules do not allow the used of "unspecified codes"
on 160m through 10m.

I think the idea of using data compression to increase reliability on the
HF bands is good. Go for it. I do, however, think you will need to get
(if you are in the US) an STA from the FCC for it. I think this should be
done since positive results from such testing would be good cause for
getting the FCC rules changed.

If you think I have interpreted the rules incorrectly, please initiate
discussion of the matter by private communications with me first, and
hold off putting it out on the net until you have tried to convince me.

The new request for rulemaking by the ARRL to allow AUTOMATIC CONTROL of
HF Digital Communications is a proposal much needed. HOWEVER, I am
concerned that the "CW Good Ol' Boys" have influenced it improperly in
one regard; The proposed sub-bands are far to small. 10Khz. on the more
popular bands is just inviting an unusable system as demand for HF
digital relay requirements increase. I think we should open the entire
General/Advanced CW sub-bands to Automatic Digital and Half of the 10M
Novice subband (Maybe we require Tech or Above license in the novice
subband). If not the full subbands then at least half. This leaves the
Extra class segments for CW and attended Digital -- This should leave a
good "incentive" for CW users to upgrade to Extra.

Also this same rulemaking should be the place where we change the
transmission SPEED rules to BANDWIDTH rules.

Perhaps we create higher bandwidth subbands in some of the Automatic
Digital subbands.

Comments? (Send them to the FCC as well)

Is there a US source for this TNC (and thus the CORRECT firmware installed)
or other low-power, pocket TNC's which support KISS mode?

>   I just go through the
>   auto-baud routine, then type 'kiss on' followed by 'restart', and it's
>   in KISS mode until you cycle power on the TNC.
I'm curious why you go through this procedure rather than making KISS mode
the default. Not knowing this TNC I'm wondering if this is not possible.

A question of the net in general: How do you run your TNC's? (KISS mode
defaults to ON or OFF) Why or why not? I'd appreciate e-mail on this
question and I'll summarize if there is enough data.

>code" wasn't available? Am I allowed to ask you to make up your mind? :-)

No. :-) Actually, I see no contradiction here: while the addressing
scheme itself may be a hack, the code which implements it is
production-quality. Look at how easy it is to set up a W0RLI, etcetera
BBS. It's so simple that new ones pop up daily by hams who have a basic

PC and very little computer knowledge.

>>Don't like it? Come up with a production system that does it the "right"
>>way.
>This is an unrealistic request. I think Brian is being a bit harsh, but in
>the long run, he's right. It would have been *so* much better for the creative
>energy that has been expended inventing the HF routing scheme and putting it
>to use to have been focussed on, say, building better automated routing
>mechanisms for NET.

Brian has a religious fervor about his idea of how domain naming and
routing should be done. It's unrealistic for him to expect others who do
not share his fervor to do things his way, especially when his way won't
work without the full network, or large portions of it, are in place,
but the other way will (and does) work. This is no different from the
production code vs. neat hack argument: production code works, neat
hacks may not. Hams want something that works, and don't care how
technically pure it is.

>The ham radio community, and the packet radio neighborhood, are far too small
>for us to be able to afford fragmentation and survive. We ought to be working
>on how to work together, instead of pissing on each other...

I'll go for that. I'll stop here, except to note that the pissing is
coming from both sides of the issue.

From article <26897@sequent.UUCP>, by brians@sequent.UUCP (Brian Sheets):

> Is there now in orbit or will there be a packet node on an OSCAR sat?

Brian:

On Jan. 11, 1990 at 0135 UTC we will launch six amateur radio satellites on board an Ariane 4 along with the primary payload, Spot-2. Three of the satellites are dedicated to packet radio experiments. Two Microsats, PACSAT and LUSAT are store and forward packet radio satellites designed and built by AMSAT-NA. AMSAT-LU designed an experiment for, paid for, and send LU7JCN to the states to work on LUSAT. We in fact exploited his great talent and he worked on all the spacecraft. The other packet radio payload is UOSAT D which is designed and built by the folks who brought you OSCAR 9 and 11, the space engineering unit at the the University of Surrey in Guildford, Surrey, England. The other two microsats carry other experiments as their primary payloads, but again, they are packet oriented systems with all telemetry and experiment data being sent down to earth on packets. The DOVE microsat is an educational payload. DOVE stands for Digital Orbiting Voice Encoder. I am the primary experimenter onboard that payload and it was built for and paid for by PY2BJO, Junior de Castro a philanthropist and long time AMSAT supporter from Brazil. This satellite will talk to earth in synthesized voice. It also has a D/A and can reproduce digitized waveforms. For those of you with REGULAR unmodified TNC's this bird may be your entry into packets from space. It transmits is digital information, telemetry, etc. down to earth in regular BEL-202 tones just like regular tnc's. The frequency for this bird is 145.825 Mhz. It carries a powerful FM transmitter and should be easy copy (by ear) on a HT with a rubber duck. If you want to decode data you should have a slightly better antenna. The final satellite, and by no means the least, is WEBER. This bird carries a color CCD camera. It has a flash digitizer board which is triggered by a vertical sync and then captures a single frame in its memory. This set of digitized picture elements will be sent down on AX.25 UI frames (beacon frames) on 437.075 or 437.100 using binary PSK (standard TAPR-PSK, or G3RUH psk modem) at 1200 BPS or 4800 bps. At beginning of life, it will be strictly 1200 bps.

I will turn on all four spacecraft at about 0300Z as the spacecraft cross over the equator going north. This orbit will carry the satellites over the panhandle of Florida and northward over the eastern US. The next orbit over the US will occur around 0530 UTC and will go up over west Texas, Colorado, etc. The next will be just off the west coast.

I will be posting a set of group elements that ought to be good for all seven payloads for at least the first two weeks, here and on other forums.

Bob

Concerning the discussion of re-inventing a naming scheme
by Hams and it's usefulness for routing, I think Brian
said it best:

...remember, IP addresses are not routes.

To this I think it's as equally true that NAMES ARE NOT
ROUTES either. A thing such as callsign.state.country is
really only a name of some entity, and should not be
designed to name the route to that somethings.

Routing is a totally different issue from naming and should never
be mentioned in the same specification!

It's also false that the internet domain naming RFC requires the
use and support of NAMESERVERS. THe concept behind the internet
domain naming RFC is the ability to a hierarchy of names. BTW,
this is pretty much intristic to human nature. Consider your
first name and last name (also know as surname and family name!).

Domain name groups usually imply some sort of administrative
authority, responsibity, or control. In the case cited for
amateur radio, the only thing implied is the route, and I don't
see how admin control can even be applied.

Further, what does one do about moving, multiple routes, and
aliases, AND multiple uses ofthe same entity (can you use
your packet radio and HT at the same time).

So, Bdale is right, Brian was a little too harse, but Brian is
also RIGHT! Names should never imply routing!

N6RCE

kevinr@tandem.com

(which, taken as a whole, is the name of an entity which you can use to
communicate to the human known at birth as Kevin Rowett, and for this
instantiation is part of the internet domain 'com' under 'tandem'. Of course,
this has little to do with the route you will use to reach me, some of
which is under my direct control, some of which is under your direct
control (look down at those keys friend!), some of which is under the
control of entities neither of which we've got direct influence over
(MN for one)).

All this talk about having to set KISS defaults, MFJ TNCs popping out of
KISS mode, and the like really has me wondering whether some hams aren't
making packet radio more difficult than necessary.

I've been running a modified (I substituted a KISS PROM for the original one)
TAPR TNC-2 with the KA9Q TCP/IP program for nearly two years now. It just
sits there and purrs along day after day. If I want to check out what's
happening on a local PBBS or the DX Packet Cluster, I just dial up another
frequency on my radio and make the necessary connection. When I'm done,
I disconnect and dial back to the TCP/IP channel.

Sure, I can't receive AMTOR or WEFAX or RTTY, but I'm happily using
both TCP/IP and AX.25 packet, which is all I wanted in the first place.
With my little ol' 1-megabyte Macintosh Plus, I'm running NET, BM, and
TeachText (a simple text editor) all at once under MultiFinder. Within
NET itself, I have one window to control the program, one for Trace,
and one for Log if I want it. (Newer versions of NET for the Mac allow
even more windows.)

So take this as a vote for a back-to-the-basics TNC-2 with a KISS PROM!
It's cheap, and as far as I'm concerned, it sure does the job.

73,
Patty

Or if you want to have your cake and eat it too, just solder the kiss
prom humping on top of the manufacturer's prom with all the pins except
the chip select soldered together. Run the chip select from the board
out to the wiper of a SPDT switch, and two wires back to the proms, and
you have front panel control of which prom you're using.

Yeah, yeah, it voids the warrantee. Duh.

And, if you do the same thing to the RAM, use a DPDT switch and use the other side to switch the CS line on the RAM, you can even save your AX25 setup parameters.

we've been running 'em like this for years around here.

TIP: To solder the piggyback chip in place, coat the inside of each leg with surface mount flux-solder paste, mount and sweat in place with either hot air (prefered) or a quick swipe with a soldering iron. Be sure to bend the CS lead up, of course.

The problem I see with this whole discussion is the presumption that
one set of standards must be applied to all similar problems. The
people in the BBS world have chosen to build a routing system that looks
like domain names. They are not domain names, they are routes ... this
group have decided on a STANDARD of their own design and implementation.
It is a STANDARD because it has been generally accepted by the writers
of PBBS software, it allows for interopability of Packet Bulletin Board
Systems. It may not be a standard by the measuring stick of the
INTERNET or OSI crowd, but it is as valid a standard as your telephone
number (which incidently is Geographic and a routing system) ...

The problem I see with the RELIGIOUS position of some of the posters is
that it denies that there might be other solutions.

It is much like the battles going on in the Computer industry now, there
is one camp who promotes STANDARDS by limiting options (one O/S kernal,
one RISC chip implementation, one User Interface definition), and one
that says STANDARDS are for interopability but with choices (O/S

interface specs such as POSIX, Networking definitions, Multiple CPU
Architectures, etc.)

So lets get off of pointing fingers and get on with development in our
own areas of interest and let the better solutions "rise to the top."

BTW for the purposes of mail routing it should be easy enough to create
a subdomain "pbbs.ampr.org" if we can set our Religious points-of-view
aside.
[Would maybe look like:

Hello All,

I'm considering changing computers, the main use of which is for packet
and S/W development.

I have a limited budget so a PC with a hard disk is out of the question.

That leaves perhaps the Atari (520 & 1040) and Amiga.

Any information on these machines for Packet would be appreciated as would
experience with the KA9Q TCP/IP package.

Thanks & 73

Mike

Just because it's a STD, doesn't mean it's good, or intelligent. Cited was the telephone numbering scheme. Implied is the goodness of that "plan". Goodness is in the eyes of the beholder. The telephone numbering plan is just great for phone companies, but for users it frankly is "user-UNfriendly". Why is it desirable from a user perspective to have SOURCE ROUTING! WHy can't I dial a friends god given SSN and have telco locate the instrument my friend currently happens to be bound to?

>
>The problem I see with the RELIGIOUS position of some of the posters is

The implication here is that because the poster is fanatical (spelled RELIGIOUS), the poster should be denied 1st amendment rights as well. Seems circular reasoning.

>So lets get off of pointing fingers and get on with development in our
>own areas of interest and let the better solutions "rise to the top."

Excellent idea. Do we want source routing or not? Can we build an AMPRNET without resorting to source routing?

> As a matter of curiosity, what's the difference between DOSGATE
> and the DOS command CTTY? They both seem to do the same thing
> with the same limitations.

     There is a subtle difference, (actually a couple of differences).

The DOS CTTY command poses several problems when used with packet:

   1) DOS always echos the users keystrokes, this will cause problems
        as the user 'sees' his characters echoed back to him with the
        'nominal' packet delays.

   2) DOS is not aware of when a user is connected or disconnected. Or
        that there is any reason to know this at all.

   3) The CTTY command completly (sp?) redirects the console to the remote
       port. The 'SYSOP' has no idea what the remote user is doing.

   4) The CTTY command must be used to return control to the local console.

DOSGATE solves these problems. It (by design) does not try to be another
commercial package for remotely running the PC via a modem (like REMOTEPC,
or similar packages that allow remote use of the PC including graphics, etc).
It is designed with AX.25 packet in mind to allow *any* remote user (without
special software or hardware of any kind at the remote end) to make use of
the DOSGATE system.

  1) DOSGATE 'absorbs' DOS's echoing of the users keystrokes.

  2) DOSGATE is aware of when a user connects and disconnects, setting
      environment variables so that programs that need the information can
      'know' who the current user is. This also allows certain housekeeping
      chores to be done, like returning the current directory to 'root' and
      ending any currently running program incase a user starts a program

and then disconnects.

3) DOSGATE 'parallels' the console with the remote user. This allows the 'SYSOP' to see what the remote user is doing, and maintain control over the actions, or offer help to a user who is having trouble.

4) The local console under DOSGATE is *always* in control. The remote user can be disabled or enabled at will.

Although DOSGATE can be used without a TNC (it can be used with just a dumb terminal in a remote location, or through a modem), it was designed with (AX.25) packet radio in mind. It (by design) does not attempt to make *all* programs usable remotely. By not requiring (SP?) any special terminal software, or hardware at the remote end, anyone who can access the packet net can run the DOSGATE system. The limitating factor in this is *ALL* software to be used on the DOSGATE system must do all its I/O through DOS INT 21h calls... and should be limited to TEXT only (7 bit ASCII) programs. This will allow anyone to use the software. Alas, most software for the PC these days doesn't use the DOS I/O, and uses BIOS or direct hardware accesses. So I have been converting many interesting programs to 'C' where I can control the application.

Hope this answers your questions. If you have access to the (AX.25) packet net, connect to node 'SNH' and then connect to NM1D-2 (in Derry, NH) to see what I have done with my DOSGATE station as a simple example of what can be accomplished.

I answered this to the net because I have had several queries of this type and thought the information would be useful to many of you.

* Where is your nearest DOSGATE???? *

As a new subscriber to I-PACRAD, I am impressed at the level of information passed on this list. Here is a simple question from a packet neophyte, but it is hoped that any answer will be serious and substantive.

Would someone pass their suggestions for hardware (IBM) and software that will interface with a 2 meter data controller allowing me to run an RBBS that will allow me to send some of the I-PACRAD packett info to the local boys. Kindly be as specific as possible and all information is greatly appreciated.

Thank you.

From the point of view of the end user the difference between a 'neat hack'

and 'production code' is often not all that obvious. Therefore, I
move that we get away from that terminology. If the word 'production'
is supposed to connote 'bug free' or 'small number of minor bugs', then
this is a misuse of the term; many commercial works of 'production'
code have found their way to the end user.

Or is the term 'production' supposed to connote 'paid for' :-) ?

The same thing could be said about the use of NET/ROM. I think it would have
been better to install IP routers instead. Now that the NET/ROM networks
have been installed, it will be that much harder to change over.

>I'm curious why you go through this procedure rather than making KISS mode
>the default. Not knowing this TNC I'm wondering if this is not possible.

If someone gives me step-by-step instructions, I might. I only use the tiny TNC when I'm portable, and that's not very often, so the effort to understand (again, it's been a long time) how non-KISS TNC's work well enough to make the bleeping thing do what I want has seemed excessive.

What I really want, but won't spend the time to do since I have a ROM that pretty much does the right thing, is a KISS-only ROM for the tiny....

I *always* run KISS mode when forced to use a TNC. Period.

>one set of standards must be applied to all similar problems.

I may have implied this, but it certainly wasn't my intent. The concern I have, which I feel is worthy of an "overriding concern" label, is that we the amateur packet radio community are small enough in number, that our progress is likely to be substantially delayed if we insist on reinventing the wheel over and over again, instead of looking around to see what is good, and relatively available, before we jump in and "invent a new standard".

It's pretty clear that there are times when nothing out there is good enough, and we need to do something different. The RSPF definition strikes me as a good example of this. But, in general, the PBBS community is plagued by the same problems that I saw while participating in the Fidonet community, etc. A bunch of folks with no experience and relatively little visibility to existing knowledge about how other folks have done things are far too quick to go off

and invent something new... typically reiterating the same series of stumbles and falls that others have already suffered.

To me, at least, the argument about nameservers is moot. If you come down to it, building a nameserver from the existing specs would probably have been an easier job than designing and implementing the BBS routing mechanism?

>The problem I see with the RELIGIOUS position of some of the posters is
>that it denies that there might be other solutions.

It's unfortunate that we frequently fuzz the distinction between well-reasoned thought and religion. I'm quite guilty of it, I admit. In many cases, such as Brian's, I think it comes from answering the same question two-too-many times... The real failing, I think, is that somehow even though we call ourselves "communicators", we do a really poor job of communicating. Both on the part of those "in the know" who don't work hard enough to spread the word, and on the part of the general ham community, which is notorious for being more interested in "doing it my way" than in researching existing alternatives.

Sigh.

>BTW for the purposes of mail routing it should be easy enough to create
>a subdomain "pbbs.ampr.org" if we can set our Religious points-of-view
>aside.

>kd7uw%nc7f.ut.usa.na@gateway.pbbs.ampr.org

We've talked about this few times. But it really does work just as well to do

    kd7uw%nc7f.ut.usa.na@nn2z.ampr.org

or equivalent for now, where nn2z is an advertised gateway for the local community. The only reason to create a '.pbbs.ampr.org' pseudo-subdomain would be to allow constructs of the form

    kd7uw@nc7f.ut.usa.na.pbbs.ampr.org

There's a better way to do it. Since a gateway ought to be able to map from a callsign to a route, all the SMTP user should have to do is:

    kd7uw@nc7f.pbbs.ampr.org

with the gateway understanding that the way to get to nc7f.pbbs.ampr.org is via the PBBS network with the full h-address.

I'd almost be willing to accept that, but in reality there's no reason for the 'pbbs', as I don't want to have to care, and MX records ought to be able to point mail for 'nc7f.ampr.org' to the closest SMTP/PBBS gateway, and the gateway again should be keying in on the callsign. So, as far as I'm concerned,

    kd7uw@nc7f.ampr.org

This is as good as it gets if we treat you as a user of the nc7f system.

If you'll allow me to really dream, why can't I just send mail to you as

     john@kd7uw.ampr.org

and let my blooming nameserver recognize that your mail should be routed to nc7f.ampr.org, etc? With proper software, nc7f would know that he's a service provider for you, and that when he sees mail for 'user@kd7uw.ampr.org', that he's expected to dump it into kd7uw's mailbox. Sendmail gets paid to do this kind of stuff on my systems all the time...

This brings us back, I believe, to exactly what Brian was complaining about to start with. In the Internet community, is is recognized that an address is not a route, and therefore a separate "envelope" is maintained by SMTP for each "letter" being sent. The address on the envelope is subject to being manipulated as part of the mail routing process, in much the same way that the USPO frequently stamps a "forward to" address on an envelope, except that with electronic mail the stamps tend to be the rule and not the exception. The problem with the BBS community's approach, to me at least, is that by not recognizing this distinction, they're making it necessary for the sender to know more about the actual destination than he should have to, and making it more difficult to rationally design software to remove that burden.

Sure, what they have works. But it's not general enough to withstand efforts at "internetworking". And, just as the Fidonet community moved from a flat address space to a net/host pair, to zone:net/host triples to whatever they are doing now, the PBBS community's requirements *will* change, and they aren't taking advantage of *existing* knowledge to help insure that they'll be able to make those changes gracefully.

I'm all for originality and freedom of expression, but this strikes me as a painful waste of a limited resource... packet radio software manpower!

Oops. I got religious again... /o\

>So take this as a vote for a back-to-the-basics TNC-2 with a KISS PROM!
>It's cheap, and as far as I'm concerned, it sure does the job.

Patty, I agree. The problem is that Heath/Tasco don't provide a KISS-only EPROM for the "pocket packet", and it's too cute to ignore. :-) And to me, at least, since it's one of many TNC's in the shack, it just isn't worth writing a variant of the TNC-2 firmware to handle the CTC baud rate generation and differing addresses in the Toshiba Z80 monster-chip...

Note that the "BBS net" addresses are not routes, but locations.
Routing takes place at the individual servers, and can be based
on any of the location information, or on the addresses.
OR.USA.NA is a location, and does not say anything about
how one could GET there, but just where it is located.

Jay, What's the "common sense" that you speak of in SOURCE ROUTING?

The quickest problem to point out is what happens to your traffic
when one of the routers in the path goes away? And how do you discover
the new path?

Happy New Year to all.
Well , it seems (as Brian writes, also in the tcp-group) that
Names and Routes are still intermixed.
              Please Note:
Names are NO Routes.
              Also NOTE:
Routes are no Names.
The domain stuff uses NAMES. Still a flat name-space and indeed having its
problems incorporated BUT HAMS live with inperfect solutions.
(If it was perfect it would not be hammish).
On the PBBS side CALL@PBBS.COUNTRY.STATE.WORLD.UNIVERSE is not a NAME but
(SURPRISE.....) a route. Yes, a ROUTE. We as pbbs user have to tell the
system where it has to go to.
Please do not mix those XX@YY's with XX@YY's . They look the same but are not.
Please note the similarity wit STAMPS.
STAMPS look the same but old stamps have no value to a mailman and new stamps
have no value(yet) for a collector. Yet both are stamps and look, feel and
(yes) even are the same.
For every one connected to (a part of) the Internet , NAMES are unique and
a route to them can be found trough servers (i.e. NAMESERVERS). Once you are
on your own(i.e. outside and not connected to the Internet) , No one can tell
you how to get "there".
 And those telling that an IP address has no routing info in it has to
rethink.... Look at 44.137.x.x and YOU KNOW that you have to cross the atlantic
 to reach it. (it does not give a direct beam reading but close.)
Lets al start this new decade with saying together:
NAMES are NO ROUTES.   (but dammed handy if used that way).
Regards, gerard.

Or, yet another possibility: To avoid messy soldering (on the EPROM, at
least), obtain a 27C512 and copy your original ROM into one half of the
64K address space, and KISS into the other half. Then use the switch as
a ROM select by changing the state of the A14 line.

But I still like Patty's solution the best! :-)

Please note that there are manufacturers out there have have made piggy
back sockets for ram and rom parts. If you use those then all you have to
do is connect those (of the socket, not the prom) two chip selects to

a switch as Brian suggested. This allows for easy prom upgrade....

I don't have my data books handy or I'd leave you with a part number, sorry.

I think Hank hit the nail on the head. I have been wondering how one
could apply the term "source routing" to the W6XXX.CA.US.NA type
scheme. A "source routing", scheme as I understand it, is to specify
the entire path , as is done on Usenet (foobar!nerdley!fonzy!..etc).

The ham packet network is not a network in the same sense as the
Internet. It is a "bucket brigade". The decision that needs to be
made at each BBS is, in the case of a destination address that is
not directly reachable, "which 'next node' do I send this to?".
Which way do I "pass the bucket". Knowing the geographical location
of the destination drives this decision. Given the poor connectivity
of the network, the only other solution would appear to be maintaining
a "nameserver" at each BBS, which is the way things were originally
done. This is a pain in the wazoo..

I have been reading all of this talk about "source routing" evils
and so on.

I am a user of both NOS and MSYS1.06 at my shack (as well as BSD4.3
IP ala Domain/OS) ...

In my NOS config I have several statements like

route add 44.70.0.0/16 n4pcr 1

(same on my Msys IP side of hings)

For BBS "H" routing I have statements like

"IL" in route table for nc7f (the next PBBS east of me) ...

n4pcr probably has some route statement to some other host for
"44.70.0.0" ... and so on.

nc7f sends "IL" traffic to a station colorado or to an HF gateway ... I
don't know and I don't really care.

So if I want to SMTP or Telnet etc. to someone in ILlinois, it goes
through a routed station in the Chicago area ... I know the first HOP
in the path ... but not the rest, nor should I need to know or care.

If I want to send a piece of traffic or bulletin to IL ... I can
address it to "DEST@CALLSIGN" which gets converted to
"DEST@CALLSIGN.IL.USA.NA" and once it leaves my station I don't know how
or care how it is delivered (I just want it delivered).... I can also
list the "IL" destination on several host routes and it will be sent by
the first available (have I hard time in NOS in figuring out how to do

this.. anyone worked it out N4PCR-1 NET/ROM only shows up occasionally [via a wormhole in california somewhere]) ....

SO WHAT'S THE BIG DIFFERENCE?

I like IP better because it is a standard I can use to connect to real computers (like my Apollo Unix box) but I am able to move a lot more information (today) to remote sites using the BBS "H" forwarding system.

I think there is room for both.

Also, my comments concerning the "RELGIOUSITY" of certain individuals is not meant to "deny them first amendment rights", it is that this attitude has created a dictatorship of the "AMPR.ORG" domain and Network "44" ... This dictatorial attitude prevents any democratic aproach to the question of subdomains, administrative subnetworks which can use geography for pragmatic reasons (eventhough you see geographic subnets in internets all the time), summary decisions to allocate less that full byte subnets without user input, etc. (I found the DIETY, MOTHER, and ADDRESS analogy very telling).

I have a dream of someday "AMPRNET" becoming a network whose policies are not dictated but openly discussed by representatives of all the services which fall under the Amateur Packet Radio umbrella and that various needs can be met through an open process. I would say that a majority of users just want Email and Bulletin services, lets make the path easy between them and those who want the higher services of networks like IP.

Sorry about the weird sentence structure and possible spelling and
punctuation errors in the last posting. VI is a little choppy when my
2400 baud modem is connected to a local host and then runs through PEP
at 9600 baud to a remote host.

John

I've seen a great deal of mis-information recently
concerning how routing is handled in the "bbs net".

Mostly the folks talking about how it is done do not
appear to understand the process very well. Some of
them claim to have a better technique. To those who
know a better way to do it, please tell me about it.
If there IS a better way, it will be implemented within
a few weeks, and will replace the techniques now in use.

i.e. don't tell me I did it wrong unless you are
prepared to tell me how to do it right.

There is no "source routing" done in the "bbs net".

    a LOCATION is not a ROUTE
    an ADDRESS is not a ROUTE

The fact that I'm in OR.USA.NA tells you nothing about
how to get here, it just tells you where you want to
end up when you DO get here. There may be many routes
that satisfy the destination location from any given
source location. The routing is done at each host in
whatever route is used. Each host will normally have
many different routes to chose from when attempting to
satisfy a given destination location. In one sense,
you could say that ARP is distributed throughout the
network, and uses local information to solve local route
problems.

Remember also that each human has a unique ADDRESS (their
callsign) and that ADDRESS is attached to a LOCATION via
the WP process and database. There is nothing here at all

that speaks to the problem of ROUTING. Only the problem
of LOCATING has been addressed, ROUTING cannot be solved
until LOCATING has been solved first.

In the "bbs net" world, each individual is identified as:

USER_ADDRESS@HOST_ADDRESS.LOCATION

I have a need for a strange kind of DIGIpeater operation and I'm
wondering if it can be done with "off-the-shelf" TNCs and firmware.

I would like a TNC on 2m to have the callsign N0JCF (ie, no SSID).
I would like a TNC on 70cm to have the callsign N0JCF-x (any SSID
will do). Both of these TNCs are together at a site remote from
my QTH. At my QTH I have a third TNC with callsign N0JCF-y (you
supply another SSID). Now for the tricky part:

I would like a user on 2m to be able to connect to N0JCF and then
be automatically (without further keystrokes) be connected across
the 70cm link to the TNC at my QTH. The TNC at my QTH should
see this as a new connection..(ie, signal any PBBS software that
a user has just connected). The 2m user can then interact with
any PBBS software...and if he should disconnect, then the whole
link will be broken down and ready for another connect.

Am I making any sense? What's the point? well, I want to get
the 2m packet stuff away from the QTH where I am trying to do
weak signal 2m SSB and OSCAR stuff. Moving all of the packet
to 70cm (or maybe 902) would eliminate the desense I am getting
from the 2m packet transmitter. The majority of my packet buddies
are all on 2m and I'd like the connection process to my station
to be as simple as possible (ie, connecting to DIGI, issueing

another connect request to me is a drag...and they won't talk
to me anymore.)

Anyone know of a way this could be accomplished? I'm not fully
up to speed on how NET/ROM or TheNet works...but maybe it
has an autoconnect mode like I am describing...

| What I need is a source of "free" RF tight boxes.

Around about Christmas time each year, you can get tins of butter cookies. Most of the tins are round :-(, but some cookies (especially Scottish Shortbread -- YUM!) come in relatively square tins. Sizes range, but 8" x 8" x 2" is about average. They are usually made of tin plated steel. I've never used one as an RF shield, but I have turned them over and "air boarded" simple circuits on them.

Air boarding: Didja ever notice that them little components come with 2 to 3 centimeter leads on 'em? Well, them ain't leads, thems just real short wires! Air boarding is 3-d breadboarding without the breadboard. (You just solder the leads together.) (UGH!)

Ok, here goes. The routing designators are currently parsed from left to right. This causes JA1KSO.42.JPN.AS to match wild-card ZIP codes, such as 42*. You solve the problem by stating that all fields below the state or province level should be prefixed by a #-sign. This makes the whole scheme look like a kludge!

You can work around this problem by making the BBS aware of its own full hierarchical location. Then just parse the routing designators from the right to the left, instead of the other way around.
Suppose you are W0BBS.NOCAL.CA.US.NA. If you get a message for

K1BBS.SOCAL.CA.US.NA your parser should not bother about the right-most fields that are common to both addresses. The BBS would first search the forwarding file for entries matching K1BBS and K1BBS.SOCAL. If no matching entry is found, the left-most field is stripped off. In this example the fwd file would be searched for SOCAL.

If the same BBS as in the previous example gets a message for JA1KSO.42.JPN.AS the forwarding file would first be searched for the full address, or if that fails the BBS would try to find 42.JPN.AS, JPN.AS, and finally only AS.

Incomplete addresses can also be handled appropriately. In the example above, a message for W0XX.42 would be treated as W0XX.42.CA.US.NA since 42 does not match any known state, country or continent designator.

As an aside, the users of BBS-systems should demand that mail to foreign stations should be sent to the right gateway even if no routing information at all is supplied. It is miserable that a BBS user should have to help the computer with the mapping of prefixes to country and continent designators. Computers should help us, and not the other way around. A good start would be by letting the BBS derive any country and continent designators it needs by looking at a prefix table. The prefix table would not take more than a few kilobytes of disk space if it is encoded properly, and would seldom need to be changed.

     Well I think you can do the 2 freq gateway with only one
standard tnc, A couple of guys around here have had gateways running
from 220(novice band) to 2 meter pbbs frequency. Although not the
best way to manage spectrum space it will work.

```
2 meter speaker out -\            /- 2 meter mic in
                ==== TNC ===
70 cm   speaker out -/            \- 70cm mic in
```

     anyone digipeating through either side will be digited
on the both sides of the gateway.. One TNC, one callsign 2 freq,
no additional operator intervention aside from a normal digipeat
command.

Julian Macassey Writes:
>someone on this newsgroup mentioned that they had a repeater running the
>GRAPES 56KB packet modem. Any details?

The packet working group here in Ottawa has assembled and tested a repeater based on the DSY modem. It uses a regenerative design, ie: after down conversion from 220Mhz to 28Mhz on the repeater input the signal is fed into the DSY modem for demodulation, the synchronous output from the modem is fed into a shift register which is used to buffer the data as the modem uses seperate clocks for the modulator/demodulator. After buffering the data is sent back out to the modulator, the 28Mhz modem output is up converted to 70cm (10w) and voila| The advantage to our design is that we "siphon off" the bits after demodulation so we can feed them to our IP router/gateway/nameserver/network wonder object thereby allowing us to have a node at our repeater site without investing in another DSY modem. Also, operating split band eliminates the need for a duplexer and the carrier detect in the modem comes in handy for keying the repeaters xmiter. I understand that Phil Karn is working on a linear translator which of course does not require a DSY modem at the repeater site. It also may reduce the chance of packet collisions.
While a regenerative design does increase the chance of packet collisions by introducing additional time for carrier detect through the repeater, early tests show that no increase in txd is required over a half duplex DSY modem. Also the full duplex design of the repeater will allow some clever programmer to write a driver for NET that checks for packet collisions in real time, which should make up for the slower carrier detect.
Write to Barry, VE3JF for information on his design of the regeneration shift register. All the rest of it is pretty much off the shelf..
Well you DO need to assemble the modem from a kit..
Our site visit for installing all of the above is tomorrow. User testing to follow.

Paralleling the speakers of two receivers into one TNC just about guarantees that you'll run into hidden-station collisions. You can resolve this by having one receiver have priority over the other (i.e., it mutes the other receiver), but that still causes problems.

I think your problem is better solved by having a remote-base - that is, you have a 444 MHz link from your station to the 2m radio, and a 449 MHz link back from the 2m radio to your station. You can do this with a total of three TNCs if you want the link to be all digital, or you can do it with just one if you want the link to be audio. Add some smarts at the remote site and you can even have the distant 2m radio be frequency-agile.

Remote bases like this are real common in So California, although not for the reasons you want to do it. The first one is reputed to have gone on the air in 1956 or thereabouts, so it's not exactly a new idea. There are more than 500 of them in Los Angeles and points south.

There is some software which is now widely used in the UK and is spreading

to Europe which does this, and is written by yours truly. If no routing information other than the destination BBS is given when a user sends a message, the BBS looks up a file on disk and adds as much information as it can. As a bare minimum, it can work out that a G callsign needs .GBR.EU added, a W, K, A etc needs .USA.NA added, etc. Further details can be added to the lookup file as necessary.

Brian

Yes, but is it available via uucp/dialup?

I would like to see more people learn about modified LZW compression. Its a truly elegant solution to stream oriented data, since compression and decompression can occur on the fly, rather than this "scan before hand stuff", or compress based on tested (but fixed) statistics.

Modified LZW does not give the *BEST* compression, but it is simple, clean, and can be inserted when required in the data pipeline, at both ends. There is no table to swap, and the table that is built is done on the fly, and adapts to the data being sent at the given instant-- rather than some crusty test done in days gone by. The table size is managable (review modified LZW as used by *.GIF files), and implementation is cheap (notice how many archive programs use it as one of the methods (ie: UNmodified LZW)).

The receiver builds its own table on the fly, and always has enuf information available to decode the incoming, compressed stream.

Lets update our methods.

I'd like to see something of this nature occur within the new HF TNCs. If it does, then the above is not required at the application level, because compression will already be in the pipeline. The BBSes won't know any different, and any compression they do, will only heat up the microprocessor chip :-) because little gain will ensue.

73s.

It sounds like a plan! In the mean-time, I have gone back into the source
and surrounded the spawn with "uchtimer" and "chtimer" as a quick fix. My
very limited testing late last night shows that the change seems to cure
the problem.

Since I have only just begun to wade thru the sources and admitedly don't
know a whole lot about the NOS internals, I'm wondering about the design
philosophy. It seems you could either just "un-chain" NOS from the timer
interrupt, or possibly set an internal flag before the spawn such that
the timer interrupt routine would simply 'fall thru' while NOS was suspended
by the DOS subshell. The only reason I can think of that you might want
to go ahead and keep incrementing counters while NOS is frozen, is maybe
to keep up on the tcp backoff algorithms? But I think I'd rather just
freeze *everything* in NOS while it's suspended since it could be frozen
for 10 seconds, or 10 hours (I've been interrupted by the baby or dog
while editing mail, and then forgot to go back and finish until later
that day :-). Anyway, there's probably something I'm missing. Just
trying to become educated :-).

  Just to remind that compression on already compressed data *can*
actually _expand_ it !!

  But that besides, its a good idea to get the compression into the TNC.
The BBSs can just throw out their stream compression.

I too am very fond of LZW compression. I use it all the time, especially
over packet radio links and over SLIP phone lines.

If you're going to compress transparently, I think the best place is just above the transport protocol, e.g., TCP. You really don't want to do it at a lower level when you've got packets from different streams being multiplexed. The changing statistics of the different streams will keep the compression algorithm from achieving its best efficiency.

Also, it's difficult to do compression unless you've got a reliable protocol below you, and it is quite common to use less-than-reliable link protocols for performance reasons.

The biggest problem I see with transparent compression is the table space required for the algorithm. LZW can be very memory hungry, and memory is not in unlimited supply on a DOS machine, especially if you want to have several compressed streams going at the same time.

Phil

RE: FIXMAIL, a Bmailer aid from Bryan (HIGH-Q) Biggers, N9GBJ

Bdale writes 'what does FIXMAIL DO' ?

Here's the docfile for V1.02. It was last upgraded 12/08/89. 1.01 had some small bug.. 1.02 fixed the bug and added the ability to use an "*" wildcard.. It also added some user-mail statistics keeping features.

"Documentation" for FIXMAIL

This program works with the KA9Q TCP/IP NET package, and in intended to simplify dealing with reams of outstanding mail for people who are not always on the air. The program will lock, unlock, erase, count and consolidate mail for individual users. Using this program, you can free up your outgoing mail slots for those users who are actually on the air, and later manually

unlock mail for users who are on infrequently when they finally get back on.

Using this program, an elaborate .BAT file could be constructed which will perform these tasks automatically for your particular situation. Each function returns an error level which can be detected with the batch file "language" IF ERRORLEVEL command.

The program always takes at least two command line arguments.

FIXMAIL COMMAND USER [FILENAME]

The COMMAND and USER parameters are not optionall; they specify the program action, and the user name whos mail is to be acted upon. Use "*" as the user if you want to include everyone.

COMMANDS:

COUNT - Returns with a simple count of the number of peices of mail which are waiting on your system for the specified user. If you are using a .BAT file, the program will return with error level 0 if there is no mail for that user, and error level 2 if there is mail waiting, and 1 if there is an error.

TXCOUNT- Like count, but returns with total number of bytes waiting for call. This takes a bit longer.

LOCK - "Locks" all mail for the user by creating a ".LCK" file for each piece of mail. Any outstanding mail sessions with the user will remain open. This command, in conjunction with the net "tcp reset nnnn" command, will allow you to lock any outstanding mail for this user and free up an outgoing smtp mail slot. Returns error level 0 if successful, 1 if not.

UNLOCK - (also DELOCK). "unlocks" all mail for a given user. Use this command when they finally turn their station on. Returns error level 0 if successful, 1 if not.

ERASE - (also DELETE). Deletes all mail for the user, .TXT,.WRK and .LCK files. This is quite permanent, so watch out! Returns error level 0 if complete, 1 if not.

COLLECT- This command requires the optional file name. It will collect all mail for the user into the specified file, appending it to any pre-existing text in the file. Two blank lines are added beteen peices of mail for clarity. This command does NOT also delete the collected individual pieces of mail, so you

should run the program again with the erase command if you desire this. Returns error level 0 if complete, 1 if there is an error. For example,

```
fixmail collect n9xyz bud.txt
```

will add any waiting mail for bud to his text file bug.txt. Your conscience will be free, and you can free up your mail slots. You can decide what to do with Bud's mail later; chuck it, mail it to him in the distant future, print it out and mail it to him...

APPLICATION NOTES:
Run FIXMAIL right in your mail queue directory (usually \spool\mqueue). I decided against trying to locate and read the appropriate setup files to find the mail directory. Use the returned error levels and build a big batch file to handle your particular situation.

RUNNING IN THE BACKGROUND.
The program will have difficulty in the rare instance that it is run in the background at the same time as net, and smtp removes the .WRK or .TXT file in the time between when FIXMAIL determines which files are present, and gets around to acting on them. The program is supposed to detect this situation and issue a warning, but I have not been able to test this. In any event, no harm will be done.

Enjoy the program. If you modify the source code, put in a comment so others can see what you did. Send me a copy! I might learn something.

Bryan D. K. Biggers N9GBJ 44.92.0.3
4521 Sentinel Pass
Madison WI 53711

P.S. Mail to Bryan: bryan%n9gbj@pgd.adp.wisc.edu 128.104.198.22 if your questions cannot be satisfied via REC.HAMRADIO-PACKET.

P.P.S. FYI, here's a snapshot of the initial FIXMAIL screen:

```
 Log into the mail directory before running this.
 N9GBJ TCP/IP SMTP mail manager. Version 1.02 December 8, 1989
 Copyright 1989 Bryan D.K. Biggers.
```

USAGE:

```
FIXMAIL command call <filename>
command:
             erase  - erase all mail for (call)
             lock   - lock up all mail for (call)
             unlock - unlock all mail for (call)
             collect- Collect all mail for (call) into (filename)
             count  - Count number of jobs for (call)
             txcount- Count number of jobs and total bytes for (call)
Call:
             Call sign, alias or address of station. Use '*' for all.
filename:
             Optional file name for collect command.
             Appended to any existing file.

 Log into the mail directory before running this.

P.P.P.S  You will need/want PKZ102.exe  (PKZIP/UNZIP version 1.02) to "unzip"
this stuff.  If you have an older version of PKZIP, you'd better GET the new
one off: pgd.adp.wisc.edu 128.104.198.22 or you won't be able to unzip it.
PKZ102.exe is a self-extracting ZIP file.  I suggest running it in it's own
directory FIRST, as it will turn into MANY files..  Don't forget the
"type i" :-)..

Now available is a cartridge version of Digicom64, the software-based TNC
emulator for the Commodore 64 and 128. The cartridge is autobooting, for
instant loading. Should there be a power interruption the program and
parameters will re-boot automatically.
```

A unique feature of the cartridge is the ability to rewrite and save
parameters without disk access. This is made possible by use of an EEPROM.
Unlike RAM, this memory device requires no battery backup.
The cartirdge is available in kit or assembled form. For further info

There is, unfortunately, a possible regulatory fly in the ointment. On HF we in
the US are limited to Internaltional Code #5, which does not include characters
of ASCII 128 and higher. All things considered, the FCC would probably allow
compression, but it would be nice if they would say so before we stick our
necks out.

Don't say I'm wrong on the grounds some have suggested that it's not a cipher
intended to obscure meaning. That doesn't have anything to do with it. It's the
signaling code itself.

Of course, there's always BSQ.

Frhliche Weihnacten und Glckliches Neujahr!

Holiday Greetings from Jim Grubs, W8GRT

I ordered the PK232 upgrade from AEA about 1 month ago (mid November).
When I called AEA to find out what the status of the order was, they told me
that the upgrades are being made in batches of 200 and that they've been flooded
with orders for it. They also told me that I was in the order for the next
batch of 200.

But they surprised me with some really great news:

They told me that they are sending out the new packratt software (or whatever
it's called) with each upgrade. They assured me that everyone who ordered the
upgrade, and not just those who already own the old software rev., will get
the new software.

Is this really true? Can anyone verify this? If they do, then I figure they
must be sending out 2 programs with each upgrade - the one for C 64s and the
one for IBM PCs.

>the US are limited to Internaltional Code #5, which does not include characters
>of ASCII 128 and higher.

The rules only describe the character set. Character sets are generally considered to belong to Level 6, the Presentation Layer of the Holy OSI Protocol Reference Model. The only other requirements for HF operation have to do with Level 1, the Physical Layer, e.g., the maximum allowable sending speed in baud (not bits/sec) and the maximum mark/space shift if FSK is used.

Nothing else is specified. Considering that the FCC specifically allows the use of commonly used abbreviations and signals to facilitate communications and that LZW is both commonly used and achieves 60% compression or better on English text, I interpret this to mean that it's perfectly legal as long as the original character set is ASCII (aka ITA #5) and the compression is done under the presentation layer (e.g., just above the transport layer, level 4).

So there. :-)

Phil

Fixmail, N9GBJ's Bmail manager, is now updated to V 1.03..
It's all MY fault.. I keep asking him to post stuff :-) .
Anyway, the new fixmail is named fixm103.zip (zipped under PKZ102, also
in \public). I made sure to put the release level in the file's name
so people can see if it's been upgraded etc..

So, by anonymous FTP: pgd.adp.wisc.edu 128.104.198.22

What you get in the kit is a 5.25-inch floppy that is labeled "PC-FAX."
It replaces an earlier version that apparently broke with the mailbox
software. I don't know if PC-FAX is just a piece of the total Packratt
software or not -- I'm one of the minority that don't have an
IBM-compatible, so I tossed it.

>And *Damn*, THAT felt good :-) :-)

Now, now, gang. Let's not get _too_ carried away!

I was confused too, but it turns out there's a reason. Which I think
is valid, though you may not. "Byte" refers to any meaningful chunk
of data in the (usual) 5-9 bit range, or whatever is the smallest
addressable chunk bigger than a bit. Today it's almost always 8 bits
long, but 36-bit machines use 6, 7 and 9 bit bytes too. I remembered
this yesterday when I did an ftp with "type tenex"! Octet is 8 bits,
period. So that's a good historical reason.

Also, octet means 8 bits which may not be related to each other except
in their position in transmission. Byte implies that the bits work
together. If you look at some odd protocols (Q.931 comes to mind),
you'll notice that one "octet" includes 1, 2, ...8 bit codepoints.
They're not a "byte" since the bits mask separately. A pain to parse,
but hey, that's ISDN fer ya, nothing if not terse.

Life is somewhat easier when the difference doesn't matter, but
sometimes it does.

Hello all,
   I'm looking for a portable TNC for doing some portable packet work (play). I've currently got a PK-232 for the house and it works real well (Only complaint is in my experience they (AEA) do not return phone calls).

   Looked a bit at PACCOMS Micro Power 2 specs, and looks good. PACCOM says Kiss is not a problem... Another suggestion was a PK-88 (power requirements do not look too bad).

   Anyone had any first hand portable experience with these or other TNCs?

A friend of mine from Spain, without access to INTERNET, would
appreciate information about TNC devices and all sort of documentation

(books, manuals, catalogs, magazines, addresses, etc) about TNCs. His
e-mail address is jjimenez@dit.upm.es but I can forward him replies
from my account.

Thanks in advanced.

>lower level when you've got packets from different streams being
>multiplexed. The changing statistics of the different streams will keep the
>compression algorithm from achieving its best efficiency.

     Yes, good point. I hadn't considered multi-connections. You would
not use one table for this-- u can't. Each receiver relies on the data
stream to recover the table. This can't be done if the table is shared
with other receivers. I havn't fully researched this, but depending on
the number of concurrent connections u wish to support, I don't think there
is a problem with a table for each "stream". More on that later...

>Also, it's difficult to do compression unless you've got a reliable protocol
>below you, and it is quite common to use less-than-reliable link protocols
>for performance reasons.

When selecting "quality of service", that is below perfect, u automatically loose the benefit of compression (well, at least LZW, other simpler methods can still apply).

However, I do think that LZW (modified or not), does imply a transport (or equivalent) layer, *sigh*, as u've pointed out. The connection must be complete, and reliable. However, I still don't like the idea presented in QEX of using (forgive me for saying it, here goes..... ....BAUDOT.... (yuk, wash my mouth out with soap!)) when the traffic is letters and numerals. The general idea of compression is good, just not THAT way! I feel terrible for saying that bad word, forgive me.

>The biggest problem I see with transparent compression is the table space
>required for the algorithm. LZW can be very memory hungry, and memory is not
>in unlimited supply on a DOS machine, especially if you want to have several
>compressed streams going at the same time.
>Phil

Yes, true enuf. BUT, *MODIFIED* LZW, can fix the size of the table to a comfortable maximum. How that max is decided or negotiated, is an open and probably potientially hot issue. *.GIF files use a max table of 4K symbols --if memory serves (ie: their codes do not exceed 12 bits; disclaimer -- I'm too lazy to look this up at this moment. The main point being that a limit exists).

Humm, there is some truth to this. :-) Did they mention when they'd be sending the Lithium batteries ? I received my upgrade a few weeks ago and there is a note mentioning that due to a shortage of lithium batteries, they decided to ship the kits without them and send the batteries later. This is because if your using PK-FAX or PC-Pakratt, you really don't need the battery. (I don't use those programs, thus I need the battery)

They are indeed sending out a new version of PK-FAX. PK-FAX only! This is because the earlier version of PK-FAX was incompatible with the PK-232MBX upgrade. So as you can see, this is the PC-compatible version only and does not effect PC-Pakratt.

All in all the mod looks good. It is a small daughter-board which plugs into some existing ROM sockets and the ROM gets relocated onto the daughter-board. They are doing away with the AA-batteries in favor of a soldered on PCB-type lithium battery. I have gotten incredible life out of my AA batteries and wonder what the advantage is of going with the lithium. I really dont see any problem with staying with AA's. Anyone talk to AEA about this ?

The suprizing thing is that newer style PK-232's (PK-232MBX) are being sold for almost the same price while we had to pay $69 for the upgrade. I would suspect they have redesigned the main logic board to accomidate the extra features and do away with the extra PCB. Can anyone confirm this ?

Any information anyone can add to the above would be appreciated.

73, John

I recently got an AEA PK88 to use on a temporary interswitch connection for TCP/IP. After I got it I discovered an addendum to the manual which indicated that "KISS ON" now sets all the other required parameters, HPOLL, RAWHDLC, HOST ON etc... I tried it out and outgoing data seemed to do the right thing but incoming wasn't showing up at all. Since it worked OK in normal AX.25 mode I thought it had the flavor of me doing something wrong with flow control, it always takes me a while to sort out what needs to be on and what off (:>)

However, after re-reading the manual and trying all the permutations I could think of, and since the new KISS function insulated me from having/being-able to manually configure things I finally gave AEA a call. The customer service person I talked with couldn't see anything wrong with what I was doing but suggested that hardware flow control might be enabled. Following that lead we decided to try tying RTS high, the schematic shows the input floating.. That cured the problem.

So, if you get a newer PK88 for use on tcp/ip make sure RTS is held high if you want date to flow from the TNC to the host. AEA says they will include this information in the next manual revision.

I had a PacComm Tiny-2 TNC that I bought in 10/88 and finially unloaded
on 4/89. It was poorly constructed and would do weird things, especially
in KISS mode. Among other things, it would go deaf, ie: no DCD light. I called
PacComm several times and they sent me some mickey mouse mod with a
transistor soldered to a DIP header, it didn't fix it. I replaced it
with an AEA PK-88, it was cheap ($109.00), very well constructed and has
always worked flawlessly in both AX25 and KISS modes. That's my 2c worth!

Subject: New release of Clarkson PC packet drivers (5.x)
Message-ID: <1989Dec12.220247.2431@sun.soe.clarkson.edu>
Date: 12 Dec 89 22:02:47 GMT
Reply-To: nelson@clutx.clarkson.edu
Organization: Clarkson University, Potsdam, NY
Lines: 91

Release 5.x of the Clarkson PC packet drivers is now (finally!) available.
The packet drivers hide the differences between PC Ethernet cards, and also
allow multiple (different) protocol stacks to coexist, most notably Novell
and TCP/IP.

Many bugs have been fixed. Please upgrade, as previous versions are
known to be buggy. Rather than include the entire read.me file here,
I'll just include the what's new section. Following it is the howtoget.it
file.

Changes from version 4.0 to 5.0 of the drivers:

Summary: New: 3c505, ne1000, ni9210, ibmtoken. Bugs fixed: all drivers.

Krishnan Gopalan and Gregg Stefancik wrote a packet driver for the 3c505.
Brian Fisher wrote an "Ethernet" packet driver for the IBM Token Ring Adapter.
Eric Henderson wrote a packet driver for Novell's NE1000.
Russell Nelson modified ni5210 to be a ni9210 driver. This entailed some
     changes in 82586.asm.
Russell Nelson wrote pktmode, a utility to set the receive mode.
Russell Nelson wrote pktaddr, a utility to set the Ethernet address.
Russell Nelson wrote pktall, a utility to help debug packet reception.
Trace.com is a little bit more helpful about how to run it.
Vance Morrison added starlan support to the wd8003e driver.
Eric Henderson improved it.
Deborah Swanberg noticed that the 3c503 driver didn't timeout properly
     if there was a failure to complete a transmit.
The set_address routine in the device dependent files now
     returns the address length as it should have.
Head.asm now keeps a copy of the hardware address set by set_address. This is
     used by f_get_address to return the current address. The device
     dependent get_address routine always returns the PROM address.
The set_rcv_mode routine didn't work. Not at all.
The access_type routine returns more appropriate errors.
The f_get_address routine wasn't passing the right address length to
     get_address.
Tail.asm now checks for extra parameters on the end of the line.
Dan Lanciani added changes to ni5210 version 4.2 to increase reliability.
     It works for him. Unfortunately, I have had reports from other
     people that it breaks Novell. So, these changes are in "if DAN"

conditional assembly. If your Novell connection gets dropped,
try reassembling ni5210 after setting "DAN equ 0" in 82586.asm
Packet drivers for the NE2000 and UB NIC PC/2 are in the works, but don't
hold your breath.
A packet driver for the Xircom pocket Ethernet adapter is undergoing testing.
Jan Engvald found and fixed a bug in the wd8003e memory presence check.

The howtoget.it file follows:

The Clarkson packet driver collection

Availability

The Clarkson collection of packet drivers is available by FTP, by
archive-server, Fido file request, and by modem. They come in two flavors
-- executables only (drivers.arc), and source+executables (driverss.arc).
All of the following instructions apply to both drivers.arc and
driverss.arc.

FTP:

sun.soe.clarkson.edu:/pub/ka9q/drivers.arc
grape.ecs.clarkson.edu:/e/tcpip/drivers.arc

Archive-server:

Send mail to archive-server@sun.soe.clarkson.edu and put the following
command as the body of your message:
help

This will send you a help message. Reading this help message will tell
you how to fetch the packet drivers.

Modem:

Call the Clarkson Heath User's Group's BBS: (315)268-6667, 8N1,
1200/2400 Baud, 24 hours. Change to file area 24 and download drivers.arc.

Opus:

260/360 in the Nodelist. Drivers.arc is file requestable.

Closet Clean Out Sale

Computer Items

CoCo2 w/64k ecb..... $35

2 ssdd 40 trk 5.25 drives w/Case and Power supply (dec)....$65
  This is a very heavyduty case/power supply combo.
  This is the DEC rx180 ab drive set. Worth it for the
  case and PS alone.

3 Gorilla serial printers (2 used/1 new).....$35/55
  I used to be a dealer and these are demos and 1 leftover
  Uses tandy lp7 ribbons. 5x7 dot matrix. 3/12/2400 baud.

1 Okidata 83A parallel/serial printer.....$100
  Draft quality only.

1 1/2 height ssdd 40 track drive.....$25

1 racal modem case/ps.....$25
  I used this to power and hold an ST225 hard drive until

I got a case for my computer. Ran the drive for 6 months
with this PS.

1 anchor automation 300 baud modem.....$10

==========

Radio Equipment (You pick up in NYC only!)

US Army 48-56 Mhz Fm xcvr with Schematic complete.....$FREE
  This unit is VFO controled and very clean inside.
  I just do not have the time to build a P/S for it.

Motorola Vhf Hi T-power mobile FM 25 watts.....$FREE

Hey, I just bought an MFJ 1278 "Multi-Mode Controller" and have successfully
connected it to a TS-440 and TR-2600. However, I would like to connect
it up to a Yaesu FT-727R. The 1278 manual says that radios such as the
'727 require special wiring. One option specified in the manual is to
move some jumpers and solder in a resistor (or something like that) in
the TNC. I would rather make a special cable so that I could plug any
radio into the TNC port. Can anyone tell me how to successfully connect
the '727 to the 1278 without modifying the 1278?

By the way, is it just me or is the throughput on HF packet incredibly low?
I answered someone's CQ on a relatively busy channel and it took about

5 minutes per line of text to communicate. Also, could someone tell me
why I'd rather use hf packet vs rtty vs amtor? This novice "multi-mode"
owner wants to know...

Thanks!
Tom Taylor - AA6BR

>They're not a "byte" since the bits mask separately. A pain to parse,
>but hey, that's ISDN fer ya, nothing if not terse.

well, there's in fact another reason why some bit-gurus distinct between
octet and byte:

the OCTETs appeared when the HDLC encoding scheme was established. On a
layer-1-point-of-view a 8-bit-byte of the higher layers could be
represented by 9 bits because of the bit-stuffing method, but could
be 8 bit too depending on the bit pattern.

Anyway, the term OCTET sounds something like KRTCHCEBMPFTC to me
which could be read in law drafts sometimes.

FINDLEY SPEAKS OUT ON ARF

Paul Findley, author of "They Dare to Speak Out" will be the guest on the Amateur Radio Forum this Thursday night. This is a profoundly disturbing book about the influence of an alien government on the Congress of the United States. This is an excellent chance to hear directly from a man who was driven out of the U S House of Representatives because he dared to speak out.

Hi all, this is my first post to the net so I hope I do this right.

I am currently in the planning phase of putting up a Node in the

local area. Almost all of the nodes here are either NETROM or
compatiable (TheNet, G8BPQ). I am interested in putting up something
new (and maybe exciting) here.
I have heard of ROSE's software and have been told that this is not
compatiable with NETROM. Is this true? Is ROSEs FTPable? Where?
Is the ROserver FTPable? Where?
What other options are there for Node Software?

We would like to do the following: 1) Have user access via 2m.
2) have the BBS/Mail Server off the Node on 440. and 3) access
the 220 backbone.

Any ideas, comments, suggestions or recommendations?

Thanks
   Mike Bates, KF7DQ

Last summer I posted a list of questions regarding packet radio. I very
quickly received answers to those questions, as well as Email expressing
interest in information about packet radio for beginners. First off, I
need to thank the kind souls who answered my questions:

WA2ISE   (Robert F. Casey?)   KA6S   (Steve Wilson)
frank@emx.utexas.edu   charlie@umvma.bitnet (Charlie Turner)
and especially KA7JXR (Steve Baxter), who came to my office and allowed
me to pick his brain.

I'll give a brief summary of what I learned, followed by a few more
questions. If you folks keep helping out like you have been, I can see
the possibility of putting together a sort of beginner's tutorial text
file, which could be kept on an FTP site somewhere so any interested

parties could have access to it. Meanwhile:

Nobody mentioned knowing of any TNC kits, but several people pointed out that TNC's are available for moderate prices-- as low as $110.

One could use an HT for packet radio; the main problem would be the typical HT's limited power. If the node you want to talk to is close enough, and/or you have a suitable antenna, no problem. Another problem that might be encountered with the use of an HT with packet is the transmitter's proximity to and interference to/from the computer and TNC.

Typical packet frequencies on 2 meters are 145.01/03/05/07/09. The dwindling 220mHz band is also used, though I received no specific frequency information. It was implied that 440mHz and higher bands are also in use, particularly as links between BBS's. HF packet is used for longer distances. The term "UHF backbone" apparently referred to a series of links for carrying packet traffic over long distances. A trunk, in other words.

Although packet has obvious qualities that would recommend its use for formal traffic and emergency communications (error correction, routing, eavesdropping less easy, etc.), present NTS operators tend to prefer doing things the way they have in the past. Apparently, any use of a packet network for formal traffic would have to be in parallel to the NTS. Of course, packet could be used to put traffic onto the NTS, but then it's back to pencil, paper, and CW or voice.

People familiar with how the packet community is networked give the network a "fair" rating. As near as I could make out, much of the communication is done by explicitly naming each node on the path from your machine to the message's destination. There is some enthusiastic support for the use of TCP/IP protocol layers for directing messages in a fashion similar to that used on the Internet.

Recent postings mention 9600 bps and 56 kbps modems for packet use (presumably at higher frequencies) and I have heard of the proposed use of gunnplexers (radar gun innards?) for high-speed links. This kind of progress is needed to overcome the sorts of problems that arise when too many messages compete for limited bandwidth. This message could be transmitted in about a half a second at 56kbps (plus overhead).

===> M O R E Q U E S T I O N S ! <===

1. What's this WA4DSY modem I hear so much about?

2. How much interest is there in using TCP/IP?

3. How does a packet node get to be an Internet node? Do a couple of guys wearing tool belts and hard hats show up on your doorstep dragging a long blue cable?

4. Does anybody have any information about the Gunnplexer application?

5. I am still curious to know if schematics for TNC's are available, or
   if some TNC designs are in the public domain.

By the way, there is an excellent article by Mark Waller in the December
BYTE magazine that introduces packet radio. I will, of course, also use
it as a resource in putting together a beginner's tutorial.

Thanks once again for your past and future help. Please forgive and
correct any inaccuracies or heresies I may have committed.

As a counter example, I've used Paccom Tiny 2's for both portable work and at our high speed switch sites and on our LAN BBS for quite some time. They have all worked flawlessly. We are also using Paccom TNC200s and MFJ1270s with the 56k modems--and they work fine too. I have yet to get an AEA TNC to work correctly and after a Kantronic TNC latched in transmit and melted a radio, we don't use them at all.

The internal modem in a Tiny 2 IS a problem in that you can't run the radio unsquelched like you can a properly modified 1270's modem. This fact has limited our use of the Tiny 2s to high speed links where the internal modem is bypassed by either a G3RUH type 9600 baud modem or a Heatherington 56k baud modem. In general, the Kantronic units suffer the same problem as they also use a TELEPHONE type single chip modem.

The other problem we have noticed with AEA, Kantronic, and Paccom TNCs (as well as original TAPR TNC2s) is RFI. They all radiate like mad. The crummy little tin box of the MFJ1270 does a much better job of shielding the crud from our radios.

On the software side we automatically replace the control ROMs with dedicated KISS ROMS as soon as we get the units. We haven't noticed any latchups while running KA9Q.

I have a portable packet station thrown together that consists of (1) a Zenith laptop (no hard drive, only diskette drives), (2) an MFJ 1270B sans case, (3) a Yaesu FT23R talkie, and (4) a Daiwa amplifier. Right now I have a cigarette lighter plug on the end of the power cord, but it could easily be removed and a gel cell substituted for it (I have a deep-cycle battery under my shack table and two alligator clips for it).

  I would like to second the motion for a beginner's all purpose tutorial
on packet radio. There seems to be more than just a few new people out
there with many questions and few answers. I think there is a definate
need for a beginner's tutorial that will answer some of more commonly
asked questions. And if it's kept up to date and current, there's no
reason why it should be just for beginners.
  Where do I sign up to start writing ? Lets go for it!

Ok, here's some fixed text for that section, sorry for the delay, but I've had
a few unexpected time-consumers the last week or two.

SLIP Modem Dialing

An extension to the attach command allows the syntax:

```
   attach <hw type> <I/O address> <vector> <mode> <label> <bufsiz> <mtu>
          [<speed>] [[optional '-' for debug] <send> <expect> <send> [...]]
```

for slip connections only. The send/expect sequences allow you to dial a
modem on the slip port, and negotiate a remote login to setup a slip link.

```
             \d  -  delay 1 second
             \n  -  send newline
             \r  -  send carriage return
             \N  -  send NULL
             \E  -  send control-D
             \s  -  send space  (not really needed as the
                                 cmdparse routine allows quoting)
             \\  -  send backslash
```

Note that an expect does not have to follow the last send. Those familiar
with UUCP will recognize the expect/send paradigm as being similar to that
used in the L.sys or Systems file.

>Whether or not these boards, or the artwork will be generally available
>soon I don't yet know.

John is currently in China on a consulting job. He's expected back in a week or so, at which time we'll correct a couple of obvious problems in the current CAD'ed schematics and board layouts, and then run check plots to send to N6GN and N6RCE and others to visually verify. If all looks good, we'll run a *very* small set of boards to build up and test the design repeatability... there have been some component changes made to make the design easier to duplicate with easy to get parts, nothing major, mostly RLC values in the filters.

Once all of that is done, and it looks like things work ok, we'll investigate producing distributable quantities of the boards, and perhaps investigate getting a kit made up. I'd find it extremely unlikely that anything will be available before March, as we've got a couple of other projects underway that we'd like to complete in time for the TAPR meeting late February, and that's going to keep the PCB work on the back burner until then.

Sure, but if the compression algorithm yields "characters" that are not, by
definition, among those specified....

Jim, if you are afraid of the consequences of using these compression algorithms, please stay away from them. However, I for one, am getting tired of hearing from you why things can't be done. Why don't you just shut up and let us take our lumps (if any) from the FCC.

arrl/e14

THE PLOT THICKENS

Enter, the A-R-R-L.....

REF: Sleezy Slander from: J E Kasser, G3ZCZ
Ramot, 96

Jerusalem, Israel

To wit:

>A rabidly anti-semitic net has been established by Jack Schmidling NR9Q, which meets Thursdays at 9pm on 3950kHz and daily at 10am on 14313kHz. The group calls itself "The Amateur Radio Forum". Opinions expressed include alleged Jewish control of Congress and the media, the idea that the holocast is a fiction, the notion that the U.S. should cut aid to Israel and other classical anti-semitic canards.

>Schmidling also is on the USENET computer link.

>Chaverim should resist the temptation to check into the net and argue. Please turn your VOX off and monitor. If possible, please record. It is perfectly legal for the hams to express anti-semitic opinions, but any data that may be useful should be shared with the Anti-Defamation League of B'nai Brith. Also, keep an eye out for behaviour which crosses the line of legality, e.g. profanity, infrequent identification, or threats. Watch out for statements which may be legally actionable such as malicious libel.

It turns out that Mr Kasser is not in Israel but resides in the USA. His address is Box 3419, Silver Springs, MD 20901. Phone is 301 593 6136.

In response to my phone call, Mr Kasser claims that he is not the author but posted the malicious libel for someone who wishes to remain annonymous. He also said he posted it without making any attempt to verify the truth of the content.

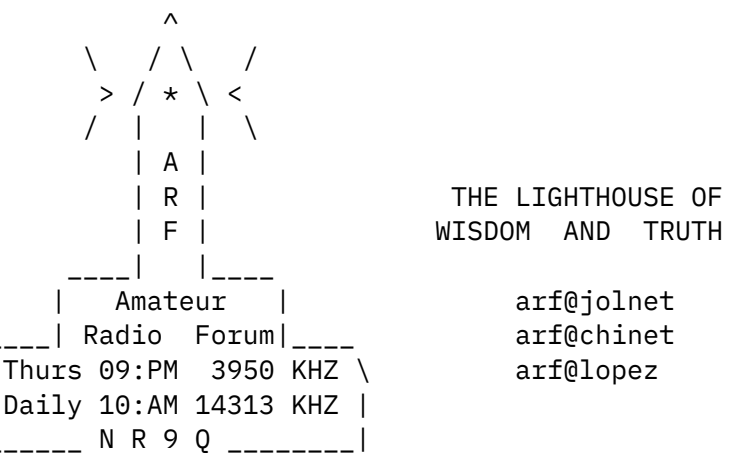
What is most interesting is that in pressing Mr Kasser for the author's identity, he reluctantly admitted that the author is a board member of the ARRL (American Radio Relay League).

I find it most interesting that the self-proclaimed, defender of amateur radio, is using our medium for racist hate-mongering. But what is most dispicable is that the ARRL is using innocent third parties to annonymously promulgate their views. If Mr Kasser persists in protecting the author's annonymity, he will be caught in the legal hassle that will ensue unless he posts a retraction as I suggested.

Before renewing your dues to the ARRL, don't forget to ask them their view on shooting Palestinian children for throwing stones.

....

If you have had it with people who try to cram their views
down the throats of American Taxpayers, e-mail to arf and I
will send you info on how to do something about it. NOW!



NEVER VOTE FOR THE INCUMBENT!!!!!

> standard.

As much as I admire the DSY modem and promote its use, I think that Phil is reaching a bit here. Since the TAPRadio uses a varactor modulator, it generates phase-continuous FSK, and assuming the deviation is set to +/- 2.4 kHz, then it *is* an MSK modem. It's a noncoherent MSK modem, to be sure, since the demodulator is noncoherent... but that applies to the DSY modem as well (and has no bearing on the transmitted spectrum). Yes, I know that the DSY actually generates "modified MSK", but I don't believe there is a significant difference in spectral occupancy between the two modems. It certainly pales in significance when compared with the gross waste in bandwidth involved in transmitting 1200 bps AFSK on FM!

I think the DSY modem is a great design, and we'll soon be acquiring more of them for this area (get some kits ready, Doug! :-), but I also welcome the TAPRadio with open arms. Let's not sell it short - it will fulfill a serious need in packet radio.

> No argument. I definitely await N6GN's radios with bated breath. But I

> dense foliage. And no, my landlord won't let me buy a chain saw. :-)

Good point. I would assume, however, that at least one end of such links can have a highly directional antenna, and that will go a long way towards eliminating the multipath. Also, some form of fixed equalizer could be worked up for multipath reduction at end-user sites (sorta like TV ghost cancellers). Not feasible for network nodes that need omni coverage, but they would presumably be well-sited and less subject to multipath (I acknowledge this is a somewhat shaky assumption :-). This stuff promises some fun times for experimenters!

I have an MFJ-1278 which I run in KISS mode under Net.
It seems MFJ screwed up something in the EPROM which makes it kick
itself out of KISS mode at irregular intervals.
Someone please correct me if I'm wrong, but I believe that electrically
all TNC-2 are identical. Would this mean that I could purchase an EPROM
for another manufacturer's model?
If so, does anyone know of a source for a cheap EPROM?
If not, thanks anyway.

     Every now and again, someone posts an impassioned plea here for
help or info on getting into packet, or learning the basics. The
best thing to do is get in touch with local hams, who can hold
your hand and direct you to local resources. If you are in
Patagonia and see this newsgroup via your own satellite link,
then you probably won't have any local radio amateurs.

     Joining a local club. Info on local clubs and societies is

available in most public libraries in most of the countries I've lived in. If you are at any US educational instutution, the odds are pretty high that there is a club on campus. Look for the antennas - Usually in the science end of campus - and ask around.

To get you going on the basics, there is an article on packet in the December 1989 edition of BYTE Magazine (Page 363).

Yes, if you want to call or e-mail me about getting going, please feel free.

Yours

Couldn't agree more. This starting arguments for the sake of argument that Jim engages on here is getting pretty irritating. Do we really have to go to the FCC to ask permission to send data? They have approved AX.25 and it ALWAYS sends characters (PID F0 or C0 for example) that are larger than 127. I interpret this to be implicit approval.

Bob

Then why not just petition to rewrite the references to data in Part 97 to describe just how flexible we want things to be. I'd like to see the rules simply say that any protocol (including scrambling that does not expand the bandwidth) may be used as long as any radio amateur or telecommunications engineer would have ready access to the specifications or equipment of a compatible type, or the specifications and contents are kept on file by the transmitting amateur for some period of time. Specific protocols should not be in the rules, except as a means of identification (such as dropping to morse code long enough to give the call sign, every 10 minutes).

Sorry to the Net for the clutter - e-mail isn't getting through.

Mark, Wow!   It would be great if I could FTP an image file and fix the TNC.
Unfortunately, I don't know how to "stick" the file into the TNC's EPROM
without a burner.

The TNC is the MFJ-1278, multimode unit, running ax.25 level 2, mfj version
2.3. I would be just as happy running it permanently in KISS mode.

Let me know what you think my options are.

Thanks again, 73, Joe, kc2yu, skohc@cunyvm

>dropping to morse code long enough to give the call sign, every 10 minutes).

Read the new rules. What you want is already there. There are now no restrictions on protocols. The FCC reserves the right to make you cease operations, keep a record of operations, or keep exact copies of all data transmitted but there are no a priori restrictions. Unless implied elsewhere, I see no requirement to even publish the protocol, though it'd be the polite thing to do.

BTW, has anyone noticed the greaser they slid in on us? Operation

at bauds greater than 19.2k is now prohibited in the remaining 220 band.
That means 56k DSY modems can't be operated there anymore. I wonder.
Did the ARRL go along with this or were they too occupied with
the latest one tube tranceiver article for QST to notice?

John

Does Digicom allow a C64 (or C128) user to operate PACKET without a TNC?
 Where is it available from, and is it Freeware, ShareWare, or Commercial?

Here we go again - committing hari kiri! This is broadcasting, not an informational bulletin pertaining to amateur radio. No wonder the FCC gets so disgusted with our lack of judgment and self-discipline.

Not what *I* wanted. But the rules do have a better structure making it
easier to petition to fix things up.

I don't want BAUDS restrictions. I just want BANDWIDTH restriction.

Hi, I'm trying to get TCP/IP running under Xenix. I have some various
sources in archive form, most of which are missing a file here or there!

I'm interested in one of the later versions that has netrom support and
the bm mailer. The local boards and phone bbs's around here seem only to
stock the PCDOS versions of the archives.

Can somebody give me a number of where to go to get this stuff? I
will gladly pay the cost of telephone UUCP time. Don't have ftp or
anyother fancy method. Could do kermit or xmodem though.

Thanks and 73! Mark WS7M @ WS7M

 > and
 > let us take our lumps (if any) from the FCC.

For one very simple reason -- when a few flout the regs, ALL of us suffer the
consequences. The FCC commonly responds to regulatory abuses in ham radio by
banning it for everyone. In the past, there was the "Eyebank Net" flap, the
fallout of which seriously impairs public service projects to this very day.
The present "20 meter letter" inquiry is a case in point. You watch, because of
a few scofflaws, we'll lose 3rd party traffic. Because of RAIN and ARF, we may
lose bulletin transmission.

Let's use an analogy -- how long would hobby aviation last if the Sunday fliers

insisted that their private pilot's license gives them the authority to carry passengers who don't "pay" fares but who give presents or free will donations? What's the harm? My interpretation of the rules is good enough for me, and if I get caught, I'll take my lumps.

I'm not trying to be a newsgroup nuisance. I'm trying to save my hobby from being ruined by a bunch of scofflaws who think doing things by the book isn't "now", who think obeying the law is an infringement on their personal liberties.

I am in the process of setting up the net-unix code on my Microport 2.3 system, and would appreciate a brief note from anyone also running on a Microport SV/AT system. It would be nice if you could include a brief comment on how you are using the software on your system. I'm looking for contacts as I run into difficulties.

I am also wondering if anyone is running XOBBS on a SV/AT system.
Thanks.

This has probably been talked about before, so replies could be sent
directly to me. Unless this is of general interest....

I was wondering, why are the characters of the callsign in an AX.25
header shifted left one bit? There must be some reason, perhaps
historical? Thanks!

There have been a number of rather confusing messages posted about the
situation in Pueblo West, Colorado. To see if I could sort things out a little
more clearly, I called Chris Knight, N0IJK. The story as he related it to me
is this:

First, we are definitely dealing with a situation involving a homeowners'
association architectural committee attempting to sue in court to get a real
estate deed restrictive covenant enforced against an amateur, Mr. Charles
Landers, W5QZS, and order him to dismantle his Butternut HF6V antenna and
remove his transmitting equipment from the premises.

The removal of the antenna is being sought on the grounds that it is an ugly eyesore. The removal of the equipment is being sought as apparatus that creates a nuisance by causing interference with telephones and entertainment devices.

The amateurs of Pueblo West (12 in number) have all been ordered to submit applications for covenant restriction variances. Mr. Knight stated that the W5YI Report statement that all 12 have already been ordered to take down their antennas and get rid of their equipment is in error. Two of them have already knuckled under and removed their antennas and radios. Mr. Landers is so far the only one legal action has been initiated against. This is because he announced he would refuse to submit an application, which later may prove to have been a tactical error.

Mr. Landers and Mr. Knight have been in contact with ARRL HQ and the League's counsel, Chris Imlay. The latter is reported to have stated that the situation is very grave because in the case of deed covenants the homeowner is presumed to have read the covenant and agreed to its terms before purchasing the property. Landers and Knight have also been supplied with the League's "PRB-1 Kit".

Mr. Landers is reported to be willing to spend up to $15,000 in his own legal defense. However, preliminary estimates of legal fees and other costs have been set at approximately $65,000. Mr. Landers is therefore willing to accept donations. The details of when, where, and how to make donations will be announced later. Mr. Landers has also been quoted by Mr. Knight as stating that he will donate a portion of any damages he may receive from any countersuit to the ARRL Legal Fund.

During my conversation with Mr. Knight he stated that the home owners' committee is being used by one of its members to settle a personal grudge against Mr. Landers. Three dogs owned by the committee member and roaming at large attacked Mr. Landers' dog while he was walking it near the committeeman's home. Mr. Landers reported him for violation of the leash law, and the vendetta ensued. Since the committee member apparently realizes he can't get away with selective enforcement, he is converting it into an attack against all hams living in the subdivision.

The committeeman is also charging that Mr. Landers' radio equipment interferes with his telephone. However, he refuses to permit tests by the telephone company, and even his wife is reported by Mr. Knight to have denied the interference story. Mr. Landers is not without his local supporters. More than 360 of his neighbors have signed a petition stating that they do not consider the antenna to be an eyesore and that they have suffered no interference.

How this all will turn out, I do not know, but I will try to keep you up to date. I have urged Mr. Knight and/or Mr. Landers to acquire DIRECT access to Fidonet/Usenet for the purpose of providing more direct and more timely contact with us. I hope they will be able to do so soon.

In article <94:werner@vax1.informatik.fh-regensburg.dbp.de>,
werner@vax1.informatik.fh-regensburg.dbp.DE (Ralf Werner) writes:
> Hello out there. I just read a brief note about a sort of callsign database,
> I think it was something like "marvin.cs.buffalo.edu". I am new to this list,
> so would anybody be so kind and send me information about this service?

Marvin is an Internet server that anyone (except and CMS user) can connect
to with a telnet. The IBM problem is being worked on and should be fixed up
sometime this month.

To connect to the server, connect to marvin.cs.buffalo.edu (128.205.32.4)
port number 2000. This is usually done with a

     telnet 128.205.32.4 2000

but could be different on your OS. Help and info is available and the system
are pretty much self-explanatory.

I keep saying I'm working on new features, and I am. But they're coming along
a bit slow. Right now I'm trying to compress the data files so that the system
will take less disk space. It will then uncompress as it reads the info. It
will soon have to be moved from marvin to another machine here since marvin
is headed for the great bit-bucket in the sky in the near future. But I need
to get the data compressed before the move...

I'm not new to the list, but rarely do I truly comprehend what goes on on this
list. I'd like to get into packet radio. I have a Kenwood TH-215A handheld
(2 meter gear.) and an IBM-Xt with a free serial port. I know I need a "tnc".
Will this connect to the IBM and the audio ports of the TH and I'll be in
business, or do I need still other equiptment? DO I have to run special
software, or will my IBM modem software (QMODEM) work? What will a TNC for
VHF cost me? Any help would be appreciated. Feel free to send info to me
directly. Thanks in advance.

The docs, along with the full 890421.1 release (which is the latest official
packaging of the stuff, albeit pre-NOS), are available from several places.
One is on one of my machines, which is a stable source...

Via FTP, from col.hp.com, in ka9q/890421.1

The files are also available on 5.25" 360k PC floppies from TAPR:

>seperate ground for the Microphone. The MFJ only has a common audio/PTT ground.
>How can I handle this difference? Any suggestions are greatly appreciated.
>Also, any other things to watch out for would be appreciated.

I have an Alinco 70cm mobile rig on one of my TNC's. Can't remember the
model number, and I'm at the wrong end of the house... I modified the rig
to bring spkr audio out an unused pin on the 8-pin mic connector, so I could
use one cable bundle instead of two to connect to the radio. I used separate
pieces (3) of shielded cable (happend to have lots of RG-174, so that's what
I used, microphone cable is ok too), one for each of rx, tx, and ptt. I tied
the grounds together at the TNC DIN connector, and left the tx ground
separate and tied to the mic ground pin on the radio end, and tied both the
rx and ptt shields to the general ground.

Seems to work fine.

>Also, does anyone know what the current (highest) rom revision level is out
>for the MFJ-1270? Can I get new rom's from MFJ? I want to make sure that
>MFJ is as up-to-date as possible.

The MFJ is a TNC-2 clone. The latest rev from TAPR of the TNC-2 code is
1.1.6 with KISS, I believe. MFJ can certainly provide their latest ROMs to
you. Call them and ask for customer support.

[as an aside, why do we as a group always ask this question on the net or
on the air, instead of just calling the manufacturer in question? Hmmm...]

/ col:rec.ham-radio.packet / mjj@stda.jhuapl.edu (Marshall Jose) / 2:20 pm Nov 8, 1989 /

     I've decided to hold for the moment with 890421.1, and most everything is ducky, except...

     NET strips any end-of-line sequences from any text being sent with the "upload" command. I have obtained the code to provide me with some insight, but it I find the NET's general layout scheme is somewhat opaque, and I can't even find the routine where the upload-file's lines are read and sent. Hence these two questions:

A. Where is the offending section of code, and
B. Would I be able to use Turbo-C 1.5 to compile 890421.1?

     Any NET hackers out there with a clue? Thanks,

Marshall Jose WA3VPZ

Dunno officially. Call Heath and ask...

I received a ROM from Tasco for my unit made by them (Heath resells a
custom-decorated version of the same model) that supposedly supports KISS,
but I confess to not having actually tried it yet. I could make a file
available, I suppose, since you'd have to have the unit to use it.

Aw... Phil... you're showing regional bias, again...

>>Anyone know the status of the TAPR 9600 baud radio/modem combo they were
>>to be releasing??
>
>It's still being worked on, but it's taking longer than expected to get out
>into Beta test. You should be aware, by the way, that only a 2m radio is
>under development. In my opinion that effectively rules out full duplex,
>since crossband operation is by far the easiest way to get full duplex.

To be a little more detailed, at the ARRL conf here in Colorado Springs in early October, the design team met, and the remainder of the design effort was quantified. Since that time, considerable progress has been made. I think at this point it is fair to say that the design is near completion, and that PCB artwork has been or is now being generated for several of the sub-assemblies. There will be a small number of alpha-rev units built next by the design team for their own testing and verification. Once they've convinced themselves that the design works and is reproducible, they will begin to plan for Beta-Testing. I would not expect that to happen for at least 2 months, probably longer.

I take issue with the idea that full duplex is ruled out on 2m. Real full duplex isn't often what we're talking about anyway, and I fully intend to put a slightly modified TAPR packetRADIO into repeater operation on a 2m repeater pair. With users running split-frequency half-duplex at home, this should provide a dramatic performance improvement over current conditions.

>but I do have to say that I don't understand why so many people who express
>so much interest in it can't get interested in the WA4DSY 56k unit. In my
>opinion the latter is much more suitable for serious high speed packet
>operation, for the following reasons:

Hmmm. I've talked to folks about this a lot lately...

>1. The design is highly modular. You can build independent transmit and
>receive sections, and they can be on any band you choose.

This is a don't-care to the average packeteer, and smells of more money than an integrated solution, rightly or wrongly.

>4. The WA4DSY modem runs 5.8 times as fast as the 9600 modem, but for a lot
>less than 5.8 times the cost! I don't know how the 9600 modem is going to
>price out, but I would be very surprised if it ends up being less than 75%
>of the cost of a complete WA4DSY modem.

Yes, but it does cost more, and you can't run one with your existing TNC digital hardware, firmware, and packet software on your computer/terminal. It requires changing more about the user's mode of operation than just changing the modem, because of fundamental performance limitations in the existing packet "solutions". This will keep a lot of folks from ever

wanting to try it. Ergo the internal TNC-2 option in the packetRADIO, it allows for true black-box operation.

>5. And, last but not least, the WA4DSY modem design has been proven in
>actual use for several years, and it is available NOW! It's not at all
>difficult to assemble and check out; see my review in the October issue
>of 73.

I don't disagree with you on the proven design point. It's infinitely more difficult to assemble than a TAPR packetRADIO, which will likely only be made available assembled and tested and aligned. It *is* expensive to get a WA4DSY modem on the air, because in addition to the modem itself (which is very reasonably priced) you need a transverter and new digital hardware to drive it, at minimum a DRSI PCPA and your HS driver, preferably something like the K3MC card or Don Lemle's card... which means the total solution price can get nasty after a while.

Don't get me wrong, I like the WA4DSY modems, but it is *not* a potential candidate for the average packeteer in current form. If someone were to package it assembled and tested with digital and RF hardware... well, some of the flexibility would be lost, but a lot more would be on the air...

>I certainly don't oppose the TAPR 9600 baud packet radio modem project; God
>knows that even it would be a vast improvement over 1200 baud Bell 202 tones
>on 2m, and it would be a waste to slow down a perfectly good WA4DSY modem to
>fit it into the 2m 20 KHz bandwidth limit.

I think you'll be surprised at just how popular 9600 baud becomes, for better or for worse. It's enough faster than 1200, particularly when coupled with local area full duplex repeating, to be a major improvement in the state of the practice... and it's slow enough to mesh well into existing 1200 baud systems, with only the modem/radio being swapped out. That's a *big* win in the volume packeteer market... where the presence/abscense of things like split-screen operation in the keyboard-keyboard qso mode is the highest on the list of "buy" criteria... [sigh]

>But if you're going to operate on
>bands above 2m (which, in my opinion, is unsuitable for serious packet radio
>operation anyway) then the WA4DSY modem is the clear choice.

Until N6GN's FSK 900Mhz and 1200Mhz radios are a done deed. Why would you want to run 56kb, when you could run 500kb, or higher? :-)

And be careful about the phrase "serious packet radio operation". I know what you mean, and pretty much agree with you, but you're stomping on raw nerve endings... "serious" doesn't always mean fast, or high technology.

>I've got one each. They are the same. They will both run the latest ROMs. (I
>didn't order the mailbox upgrade -- is it worth $65?)

AEA customer support commented on CIS HAMNET that the mailbox upgrade is
required to get the TDM code... it wouldn't fit in the stock ROM space, and
the daughter card with the ROM bank-switching is required to get the decode
functionality. Call AEA and hound them for details, if this matters to you.

I have a PK-232, and am a casual user. It's overkill for KISS, and I'm not
an HF fanatic... but it's fun to play with when I'm tired of staring at C
source... :-)

>handles buffers. A disk with the code is included in the kit.

I'd like to comment though that making TNC-2's go 56kb is non-trivial. I
spent several long nights with a Paccomm TNC-200 and an MFJ-1270B, and had

unresolvable problems receiving more than one frame. The TNC's were sent
off to friends active in GRAPES, and have never returned...

I'd *strongly* suggest running DRSI PCPA cards with Phil's high-speed
driver until/unless DRSI starts shipping the K3MC "Awesome I/O Card", which
should be soon, and which will be the right thing to run.

73 - Bdale, N3EUA

>exclusive license! This mythical, magical board is becomming the biggest
>vaporware joke since VisiOn! I'm not picking on SANDPAC, I'm shooting
>squarely at AEA.

I won't disagree with you too strenuously. AEA has been sitting on the
PS-186 for far too long, but I've talked a lot with the folks involved, and
I really can't argue with their reasons. Most notably, that without
software, it's worthless... and S2000, which had a NET/ROM port ready to
go early on, wanted license arrangements that were considered unreasonable.

Two neat things have happened.

1) At the TAPR meeting in Tucson last February, I agreed to investigate
    porting NOS to the PS-186, if and only if AEA would promise to put it
    into production. I've got code that's almost doing the right things
    in my basement now, and I anticipate showing something in Tucson this
    February... yes, it's taken a while, but I'm a busy guy these days.

2) All the noise I generated about the PS-186 in the last year, in conjunction with natural progress, has led to the creation and imminent availability of the K3MC Awesome I/O Card from DRSI, and the de56 (or whatever the name is this week) from Kantronics. Both are V40-based, and both should be easy for me to port my PS-186'ish NOS to.

   The K3MC card was envisioned as a PC-plug-in to do end-user good stuff, and will no doubt become the interface of choice for the PC/XT/AT world. I know I want a couple ASAP! But, I've convinced them to make it also capable of running standalone... from ROM. It'll make a nice packet switch, albeit without some of the neat PS-186 features like firecode reset, and awesomely low power consumption.

   The de56 is a standalone box that I think they're billing as a next generation dual-port TNC. It's a V40 with 8530 and DMA. There's a third port for RS-232 or whatever to the host. I think it'll make a neat dual-port packet switch, maybe with a 9600 or something channel on the async port. They're supposed to send me an alpha-rev board this week, I'll put the NOS code on it too.

So, while the AEA/Sandpac/PS-186 fiasco is real, and lamentable, and has convinced me that I'll never exclusively license anything I design... it has not permanently halted the progress of packet radio... it may, in fact, have spurred some other development efforts...

We can only hope that things like the DSY modems will eventually follow the pattern, and become comercially available for our black-box brethren...

>Can somone with access to technical information about the
>WA4DSY modem please post it to the net?

I guess that it's about time I repeat my offer for Heatherington Modem Info.

I am handling information requests off-line, and have replied to Ben.

I would be happy to hear from anyone that wants information on
the Heatherington 56K modem via E-mail or regular U.S. Mail.
Information requests will be promptly handled.

I'm willing to mail out technical reprints, flyers, etc.
Please include your U.S. mail address in your message.

Even though the kits are a non-profit club project for us (GRAPES),
I don't want to eat up net-bandwidth with a lot of postings.
Besides, there's drawings,etc, as Phil pointed out.

>Hmm. I really can't answer that question. I want to build one and I
>also want to have one, which is why I am building one. I am not sure
>which one came first.. the chicken or the egg! :-) I THINK I under-
>stand what you are saying, but I am really not sure. If your comment
>means that I don't want to BUILD something... that is not correct.
>I don't mind and in fact enjoy building things. However coordinating
>the politics of building a statewide network I do not really enjoy.
>If the gear could be bought off the shelf, that goal would become
>much easier to implement. That was really the only reason I wrote
>what I did.

My father observed a long long time ago in a galaxy far away called Virginia
that I no sooner got my HO-gauge model railroad set up and wired up on the
4x8' piece of plywood he bought me for the purpose, than I'd be pulling the
track up try something different. It didn't mesh well with his vision of
long weekends spent playing with paper-mache, and plaster, and screen, and
pain, and sand, and so forth... building something that looked pretty and
then running the train around and around. I *usually* ran the train once
around the track before I pulled it up again, but not always... :-)

It was the building that excited me... I wasn't much of a user. He didn't
mind spending time to build something, and "do it right", but then he wanted
to lean back and enjoy what he'd done... as a user. There's nothing wrong
with that at all. It's just different than my eternal "there must be some
way to do it even better" approach.

The real dilemna for some of us, myself (and Brian Kantor, from what we've
said to each other) included, is that on the one hand we desperately want to
always be pushing a little bit further, but simultaneously we'd like to have
some base level of functionality that just sort of works so we can do the
mundane things like communicate with people... :-)

>>Admittedly, I'm torn between the two opposing goals of having a my cake
>>and eating it too: the challenge of building the network and the
>>challenge of making good use of it when we have it.

>
>Worry about number 2 after we accomplish number 1.

Easier said than done. The reason we have 1200 baud AFSK as a defacto
standard today is that the moment something worked... anything at all,
even working poorly... number 2 came quickly into play. Therein lies
the frustration... so many people want to USE networks that those who
want to BUILD them, correctly, get torqued to the breaking point when
folks jump too quickly to adopt experiment as standard. It happens all
the time.

>As soon as you ship me a mountain, I'll mount my darn equipment on it!

Maybe you would, maybe you wouldn't... around here, we've got lots of
mountains. They're fun to talk about, they're bears to keep RF gear
working on. You have hundreds of feet to run to the nearest electric
outlet and/or phone line. It's many miles from the top of most of our
14,000' peaks... and inaccessible due to snow for much of the year... we
just have a different set of problems... The stories I've heard about
wind-induced static buildup on Pike's Peak... [!]

Meteors make uncommon carriers
by Michael Puttre

New York--"Look to the skies."

The slogan of Meteor Communications Corp. of Kent, Wash., is not a warning against squid-faced alien fiends. It calls attention to the technology that is MCC's name sake.

Meteor-burst communications (MBC) uses meteors to send transmissions between remote sites on the ground. Building a network that relies on shooting stars, the literary symbols of ephemerality, may sound like the product of wishful thinking. But many are looking to meteors as a low-cost alternative to satellites.

As transient as they are, meteors arrive in the Earth's upper atmosphere by the billions every day, mostly in the form of mote-like micrometeors. These visitors from space have only the briefest of careers in the ionisphere, typically under three seconds. However, high-frequency radio waves can be bounded off of the ionized gasses left behind in the meteor's fiery death dives. And their abundance makes it probable that there will be a meteor around when you want one.

Getting there

A simple point-to-point MBC system is composed of a master station and a number of remote transceiver sites. When an MBC master station wants

to poll a remote site, it sends a continuous coded radio signal in the 30-to-50 MHz range. Once a meteor shows up in the proper part of the sky, the signal is reflected to a receiver at the remote site up to 2,000 kilometers distant. Once the master signal is recognized, the site transmits any data it has collected along the same path back to the master station using the same meteor trail. Sites can be relayed to give an MBC system nearly unlimited range. The actual performance of an MBC system varies due to the effects of the Earth's rotation on its axis and its revolution around the Sun. At dawn, an MBC site is on the Earth's leading edge in its movement through space. More meteors will then be in the atmosphere above the site. In the evening, the same MBC site will be on the trailing edge, so there will be fewer meteors. In the summer, there are four times as many meteors as there are in the winter because of the density of particles in certain regions of space through which the Earth passes. One observer noted that a transmission wait of two minutes at 4:00 a.m. in September compares with a 10-minute wait at 4:00 p.m. in January.

The concept of MBC has been understood since the 1930's. But at its current level of performance, meteors will not threaten communications satellites anytime soon. In fact, the advent of commercial satellites in the '50s and '60s dealt a virtual death blow to MBC. When the U.S. military, which had been the prime sponsor of MBC, diverted its R&D money into satellites, it looked like meteors were out of the carrier business. But the technology has won out over satellites for extensive networks. The largest existing MBC network is also one of the oldest. Back in 1975, the Soil Conservation Service arm of the Agriculture Department defined a set of requirements for a system to measure snow and rainfall in the 11 continental states of the American West. The SCS West Technical Service Center in Portland, Ore., was to be the hub of a network of hundreds of widely scattered, unattended data collection sites in remote, inhospitable terrain.

Data collection leader Garry Schaefer said that the SCS eventually settled on MBC as the most cost effective solution. A terrestrial solution requiring a chain of line-of-sight relay stations was discarded because of their maintenance cost.

MBC also won out against satellites for cost reasons and, ironically, for reliability. "We didn't want to be dependent on others for a down-link," said Schaefer. "We didn't want to have to wait for irregular lease time to collect data."

The Snow Telemetry (Snotel) system today consists of two master stations and 560 remote sites. According to Schaefer, Snotel cost $5 million to build and costs $1 million a year to maintain. "Satellites would have cost a substantial magnitude more," he said.

Western Union performed the systems integrations for the Snotel MBC system designed by a group of engineering consultants who broke away from Boeing Corp. These consultants would eventually incorporate themselves, becoming Meteor Communications. The company has installed approximately 50 master sites and 2,000 remote sites to date, which

represents 95 % of MBC systems worldwide.

Wishing on a star

The very importance of satellites has reawakened military interest in MBC. Communications satellites would be high-priority--and highly vulnerable--targets in wartime, and both Superpowers have developed the capability to blow them out of orbit.

This capability is not likely to extend to meteors, and therefore the military considers MBC systems "survivable." "It's a good back up for any Star-Warsiness going on," said David Kocyba, VP marketing for MCC's biggest customer.

However, Kocyba sees the real future of MBC as lying in the commercial sector. The trucking industry, for example, which represents a potential market of tens of thousands of mobile terminals, could use MBC to keep track of rigs on long-distance runs. However, MBC has to overcome its limitations before it can be considered for more mainstream communications.

"The big drawback of the system is its relatively low throughput rate of 100 to 400 words a minute," said Kocyba. Upgrading antenna design to allow the system to use even smaller meteors will increase throughput. Microprocessor enhancements will give MBC systems better definition.

A new packet-switching system is currently being perfected to replace the point-to point communications now used. Automatic routing will allow an MBC site to use one of many meteors rather than waiting for one to connect it to a specific master station. Kocyba said that some packet-switching capability is now available to MCC customers, but that the concept is still maturing. Once thethroughput and networking performance of MBC is sufficiently improved, many general-purpose communications applications will be in reach. "Voice mail is possible," Kocyba said, adding that the burst technology inhibits real-time voice capabilities. It would not, however, inhibit facsimile transmissions. Long-distance emergency communications are another application being evaluted. Some sites in the Florida Keys are reportedly looking at MBC as a back up for hurricane damage.

But even today, MBC proponents have a compelling argument to take the technology seriously. Noted SCS's Schaefer: "Meteors are free."

Some new BBS software is now being distributed. The G1NNA BBS software has
the following facilities :
 * MBL/RLI/BB forwarding compatible
 * Handles up to 16 users at once in one program
 * Hierarchical forwarding
 * MIDs
 * Compression of messages when forwarding to compatible systems
All the normal features are there as well.
Could any software writers please note that the letter S is used in the SID
by this software to indicate mail compression capability (ie [NNA-1.02-HMS$]).
Details of how this is implemented are available.
If anyone is interested in a copy of the software, please either email me
or send a disk with IRCs/stamps to:
 B.Lloyd (G1NNA),
 9.Hornbeam Walk,
 Witham,
 Essex.
 England.

I'm running net on microport 2.4 (should be no difference from 2.3
except that 2.3 will sometimes panic with a serial port at 9600).

I've done several fixes:
  One was posted shortly after 890421.1 appeared, and needs to be
   applied. (I may have a backed-up copy).

  The code to handle environment variables to find the various home
   directories was badly broken (in sys5unix.c or sys5io.c) but easily
   fixed.

  The XOBBS hooks were written without regard to memory models so there
   are several places (most notably msgget(x,...) where x is supposed to
   be a long, and execl(..., 0) where the 0 should be (char *)0) that
   need fixing. Also, the xobbs hook code loops through his control
   blocks looking for a matching axcb or nrcb where those blocks contain
   a pointer back to the xobbs struct. I have fixed these and owe a
   diff file to w2xo. I also added telnet support (fixed to socket 31).
   However, I never fixed up the forwarding driver, since I didn't use it
   for the database application that I ran using these hooks. (Support
   for a 100 mile running race, to track runners for the search & rescue
   folks).

  Also, the malloc() that comes with microport is badly broken for this
   purpose. Neither the malloc in -lc or in -lmalloc will handle net
   properly. One needs a buffer-pool type of malloc for the rather high
   frequency of mbuf allocs and frees. I wrote one but haven't posted it.

  I also changed deliver() in smtp to use rmail(1), (I'm running smail
   here) but disabled delivery if there is a ! or @ in the address, since
   I don't want to get into the uucp <-> packet can of worms yet.

  I can send all of these mods to whoever deserves them in the form of
   cdiffs (or whole files), but can't figure out who that is (except for
   w2xo).

  The unix coordinator for net is supposed to be rbh@pitt. I've never
   gotten mail through to him in several tries.

> exclusive license! This mythical, magical board is becomming the biggest
> vaporware joke since VisiOn! I'm not picking on SANDPAC, I'm shooting
> squarely at AEA.

I knew this example would draw some hoots of derision! Which is why I went on to say that said license agreement needs to have some strings attached. One of them would impose a time limit on getting the product to market - if they don't make it, the license gets yanked and given to someone else. I suppose there would have to be a financial penalty involved too, so that somebody wouldn't sign up just to keep the thing out of the hands of competitors. Of course, a vendor would probably no more likely sign such an agreement than he would agree to a nonexclusive license. Oh well, never mind. Regarding the PS-186, I'm not an apologist for AEA, but this _was_ a design that was a couple of years ahead of its time. BDale's NOS port will change all that, but with no software to supply with the board, I suspect AEA was right in assessing that demand for the board would not be overwhelming.

I agree that nonexclusive is the preferred way to go. I hope that the PS-186, the Awesome I/O board, the TAPRadio, et al, do indeed materialize in early 1990. The demand for higher-speed stuff _should_ convince some vendor to take the plunge and take on the DSY modem. With all the hard work already done for them, how can they continue to resist?

writes...
>I was wondering, why are the characters of the callsign in an AX.25
>header shifted left one bit? There must be some reason, perhaps
>historical? Thanks!

Historical, but explainable. It has been a while so I'll say it here.

AX.25 is a member of the HDLC family of data link protocols. The HDLC
rules (ISO 3309) say that the frame begins with an "address" field,
followed by a "control" field. The address field is delimited by the
low-order bit; when it's a 0, the address field continues onto the next
octet; when it's a 1, that's the last octet and control is next.

So callsigns are left-shifted to make room for the continuation bit.
It makes AX.25 nominally HDLC-compliant. Personally I'm not sure it's a
great idea in the first place to base a packet radio protocol on HDLC,
but if you start with that premise, this is one of the consequences!

KD9UU asks about 16550 chips:
>Who-da-ya-know has any utility or small program to POKE my UARTS??
>I'll bet even a stand-alone program could be used before starting
>NET??

There are some subtle differences between standard 8250 operation and a 16550 in FIFO mode. While enabling the FIFOs shouldn't actually *break* existing 8250 code, depending on how it is written it may or may not be able to benefit from the presence of the FIFOs.

The receiver FIFO "does the right thing" once the FIFO has been enabled. It sets the "receive data available" flag whenever the FIFO is non-empty, and it interrupts the CPU when either a settable threshold (currently 4 in my NOS code) is reached or a hardware timeout expires with unread characters in the FIFO. So *assuming* that the 8250 receiver code has already been written to loop repeatedly on the input register as long as incoming data is available, it should benefit automatically from the addition of the FIFO; no changes here are needed.

However, the 16550 transmitter FIFO design is a little strange. The "transmitter ready to receive a character" status flag is set only when the transmit FIFO is completely empty, not, as you might expect, when there is one or more slots available in the transmit FIFO. I suppose this was done with the notion of always loading the transmit FIFO with 16 characters at a time in order to minimize the output driver overhead. Unfortunately, there is no way to tell whether the transmit FIFO is completely or only partially full. This makes it difficult to keep the line fully utilized when your interrupt latencies are long (which is why you're using a FIFO buffered device in the first place!)

A stock 8250 transmit routine should therefore still work correctly with a 16550 in FIFO mode, but it will be unable to benefit from the presence of the transmit FIFO; it will send only one character per interrupt. Code written to take advantage of the 16550 will always try to load 16 characters at a time into the transmitter, thus reducing the transmit interrupt CPU overhead by a factor of (almost) 16.

Phil

>>historical? Thanks!

This subject is one of my all-time "hot buttons".

The simple answer is that there is absolutely no reason for this
practice. It was only sheep-like, unquestioning adherence to irrelevant
standards on the part of a group of hams in 1982 who (not knowing any
better) thought that ISO and CCITT actually knew something about
networking protocols. Although I was a member of that original group
I've since learned otherwise. But a few *still* don't know any better.

There, that sure felt good. :-)

As Fred mentioned, the ISO "standard" for HDLC says that address fields
consist of bytes (sorry, I just can't say "octets") in which the low
order bits of all but the last byte are set to zero. The last byte of
the address field is set to one.

The idea was to provide for variable-length addresses in some standard
fashion, but this was a typically half-baked ISO idea because unless
there is agreement at both ends about what the variable length addresses
mean, there's no point in agreeing how they're encoded! Conversely, if
the two ends can agree privately on the meaning of the address field,
then they're just as capable of agreeing on their own way of encoding
those addresses.

The HDLC chips don't care; they only recognize flags, stuff and remove 0
bits as necessary, and compute and check CRCs. The rest, including the
parsing of the address fields, is all done in software. (Several chips
have an optional "address recognition" feature that can be used to
filter out frames except those beginning with a certain byte, but this
feature is not exploited by AX.25.)

A year or so ago, during discussions about a new link protocol

tentatively called "AX.25 Version 3" that would remove the current limitation on addresses to 6 characters, I had one particularly, uh, frank discussion with the advocates of address byte shifting. I challenged them to give me one good reason other than "ISO said so". The only one they could come up with was that one of them happened to have a commercial protocol analyzer that could read and display the LAPB control fields from an AX.25 frame as long as the address field ahead of it was encoded using byte shifting. Hardly a good reason for wasting 12.5% of the bits in the address field and making a royal nuisance for those debugging packet radio software or tracing on-the-air packets.

By the way, the name "AX.25" was a most unfortunate choice, because it suggests that it's a form of X.25. It's not. AX.25 and X.25 may both use HDLC framing, and AX.25 may use a (modified) form of LAPB, X.25's link control protocol, but the two protocols are NOT compatible. The address field in AX.25 is actually a datagram header that is unique to amateur radio, and it serves an entirely different function than the so-called "address field" in X.25. (I say "so-called" because there's little need for an "address" field on the point to point phone links X.25 was intended for. What X.25 calls an "address field" is actually used as a 1-bit extension to the LAPB control field to encode the "command/ response" indication. (The other 7 bits in the X.25 "address" field are wasted.) The "C-bits" that were added to AX.25 Version 2 restored the command/response indication by burying them in the address field. This was a truly ugly hack that I must take full blame for.)

Phil

My friend Chris has the same problem with the 1278 jumping out of KISS mode.. I am of the impression that it should jump out **IF** it receives a @255 or 00 ff, somthing like that.. Chris's jumps out with just "@F" (00 Fx he says).. He (Chris) has called MFJ. MFJ is trying to get ahold of their 'part-time' programmer who goes to college somwhere. Apparently, MFJ had RX'd a few calls on the matter. I'd like to see

it resolved, I sold him the 1278 :-) !   I guess the 1270's run well.

Has anyone had any problems running an MFJ-1278 with Net?
Specifically, any problems running in KISS mode?

It seems Net is sending certain characters to the TNC wwhich pops
it out of KISS mode. If only I could figure out what those characters
are...... I'd be back on the air. Oh well....

Thanks, Joseph Skoler,   kc2yu,   skohc@cunyvm

I was wondering if there is a way to get KISS running on a Heath
pocket Packet? Has anyone seen/used the Pac-comm battery operated TNC?
The heath will not accept a normal TNC2 rom. Will the pac-comm pocket tnc
support a normal ROM?--

IT IS SAD TO NOTE THAT THIS NET DOES NOT OFFER HELP TO ANYBODY WANTING
TO START OUT ON PACKET. INSPITE OF MANY MESSAGES FOR HELP, I HAVE NOT SEEN
A SINGLE MAIL MESSAGE OFFERING THE NEEDED ADVICE. IT SEEMS THAT THE MEMBERS
OF THE NET ARE ENGROSSED IN THEIR OWN LITTLE "PET" PROJECTS AND POSSIBLY
CONSIDER THE APPEALS FROM "NEWCOMERS" AND "NO-NOTHINGS" NOT WORTH THEIR
WHILE.

I APPEAL TO YOU FOLKS TO IF TIME PERMITTING, TAKE A MOMENT AND HELP BRING
SOMEONE NEW INTO THE FOLDS OF NOT ONLY PACKET RADIO BUT ALSO INTO THE
FOLDS OF HAM RADIO. BEING SELFISH WOULD NOT NECESSARILY WORK IN OUR FAVOR!

Ok, I have gotten net compiled and my bbs interfaced into it using
the queues like w2xo. I have been unsuccessful in getting a connect
or sending a connect request for telnet or ftp. When I send a request
to the system [44.78.6.2] I get the following:

AX25: WD5B->WD5B-2 UI pid=IP
IP: len 44 44.78.6.3->44.78.6.2 ihl 20 ttl 5 CHECKSUM ERROR (48450) prot TCP
TCP: 1001->23 Seq x61a9 SYN Win 400 MSS 216 CHECKSUM ERROR (6)

I have tried calling with two different systems and get the same results. Has
anyone else run into this problem on a Xenix 286 system? I have also been
unable to the Xenix system to send a request out ax0.

[Don't let the IP fool you in that 78 is assigned to Oklahoma. They
let us borrow a block until our assignment came through.]

This is for capuano@icnucevm.cnuce.cnr.it. (Mail to him bounces.) I'm
posting it here because others may have the same question.

>Hi,
>I've read you have written the code to allow ka9q to dial to a slip line.
>I have ka9q v891022A NOS, but it doesn't seem to recognise your commands.
>Does the code need to be inserted into the original code ? And recompiled?

>Can you send me the patches ? Or a functional copy of net.exe (preferred) ?

The dialing code was first added to the 890421.1 release of net.exe. I have
not added it to NOS at this time. It was pretty simple to add to net, but
I've not started using NOS yet and am not sure when I will. I am in the
process of modifying NOS to work on my HP Portable Plus, and when I complete
the conversion I'll look at adding the dial capability. It was a crude hack
in net, and I'd like to make it a bit more elegant (and trustworthy) for NOS.

I hope every one has read Glenn Elmore N6GN & Kevin Rowett's Dec Ham Radio Mag construction article on how to build an inexpensive high speed packet radio link @10Ghz. Those of you who have and who want to try duplicating the work may have questions like the following:

1. Did I miss the parts list in my photo-copy? What is a "SRA-1"?
   Who makes it? Can I order it from Digi-key?

2.What is a "MAR-6"? Who makes it? Can I order it from Digi-key?

3. Should it be possible to replace the pre-amp with something like a
   single stage 75Mhz-105Mhz pre-amp from Advanced Receiver Research?
   If not, why not?

Glenn? Kevin? Anybody got any answers?
No more urgent questions right now. I would like to say that this the kind of construction article that really makes being a Ham interesting. I heard Bdale talk about this project at Dayton last spring and it really is as easy and inexpensive as he said it would be, ie: less then $150/end node. I would be happy to hear from anyone else who is going to try a hand at 10Ghz packet radio. 10 megabaud or bust!

Is anyone interested enough in the WA4DSY modem to be in the market for
a 220Mhz <> 28Mhz transverter?
When we built our DSY modems last year we bought 4 xverters for $250 each
from a guy in Toronto. I think he might be interested in building some
more units, *if* he though he was going to be able to sell them. I expect
that any production run of less then 10 units is not really worth his time.
These units put out 10 watts and seem to be based on the Microwave
Modules design.
I will be contacting him about buying some units with the order being
placed by the end of Jan. 89. Is anyone interested?
Please note, I am NOT soliciting for orders! I would only like to give him
some indication of how many he *could* sell.
Please respond to me and I will post a summary for the group early in
the new year.

An update on the "Star Trek IV" packet decoding project:

Last night I finished decoding the second half of the graphs N4HY gave
me. I had made an earlier mistake in the interpretation of the control
field. The actual control field was that of an I frame with N(S)=1,
N(R)=1, P/F=0. The Level 3 protocol ID was F0, which means "no upper
layer protocol" (a very common value). My first attempt at decoding the

text field yielded the following:

    >Qt takes 4 program

(At that point, Scotty started talking over the packet, so I was unable
to decode any further.) Since this didn't look quite right, I looked at
the second byte a little closer. I found that if I flipped one
weak-looking bit, I got

    >It takes 4 program

which makes much more sense.

As reported earlier, the sender of the packet was WA8ZCN and the
destination N6AEZ. Bob, N4HY, has confirmed that WA8ZCN was indeed very
active on 20m packet until he moved to Arkansas a few years ago, but he
has been unable to reach N6AEZ for confirmation as yet. Bob reports that
Mr. Harrigill (WA8ZCN) was quite tickled to learn of our discovery, and
that he would run right out to rent the videotape again so he could hear
his callsign immortalized in the Final Frontier. :-)

My new packet BBS software (see earlier posting) compresses messages
before forwarding them to compatible systems. I am also intending to add
the ability to compress mail and text files for sending to users. I use
the standard SQueeze code (Huffman coding technique), so anyone with a copy
of USQueeze can uncompress it. The method has been published so I wouldn't
have thought it could be classed as a secret code or cipher!

Greetings.

Recently I switched to NOS and got the sources for 891022 from "flash". The conversion from NET to NOS wasn't very difficult (will gladly share my notes on how to do this if anyone wants them).

The problem I am having with NOS is in using the "shell" command. I first "shell-out" of NOS to command.com, and then run BM to create out-going mail to someone. After maybe 20-30 minutes, when I exit BM (and the DOS shell) back into NOS, the net code seems to go nuts with the mail sitting in /spool/mqueue and begins establishing multiple sessions to the destination based on that one piece of outgoing mail. When I do "tcp resets" on some of those sessions, it usually gives me a lot of "freeing garbage" messages.

I have had this happen a number of times when I have "shelled out" to create mail for a few people all at once. Even with "SMTP MAXCLIENTS" set to 5, NOS will cheerfully start up 7 or 8 sessions to each person! For the same message! I'm guessing that the NOS timers are still ticking, even though none of the NOS tasks are being serviced while COMMAND.COM is running, and upon return to NOS, those tasks are all trying to "catch-up". Interesting that one of the tasks can't get the lock file written before the others find that no lock exists. (By the way, I'm using an 8Mhz XT, 640k, MS-DOS v3.3, 30MB HD (80 ms), and one KISS attach @ 1200 bps to MFJ-1270).

In looking through the JA_BITS NOS code, I noticed that in "pc.c" under the "doshell()" function, the call to "spawnv" is surrounded by calls to some assembly code that restores the original timer-tick vector before the spawn, and then sets it back to NOS after the spawn (resvsync() & setvsync()). In 891022, those calls to change the timer vector are missing.

IN JA_BITS NOS:

```
        ioctl(fileno(stdout), 1,  .  .  .  .
        if((command = getenv("COMSPEC")) == NULLCHAR)
```

```
                command = "/COMMAND.COM";
>>      resvsync();     /* Restore original timer tick vector */
        putenv("PROMPT=(NOS)$p$g");
        ret = spawnv(P_WAIT,command,argv);
>>      setvsync();
        ioctl(fileno(stdout), 1,  .  .  .  .

IN 891022 NOS:
        ioctl(fileno(stdout), 1,  .  .  .  .
        if((command = getenv("COMSPEC")) == NULLCHAR)
                command = "/COMMAND.COM";
        ret = spawnv(P_WAIT,command,argv);
        ioctl(fileno(stdout), 1,  .  .  .  .
```

It appears that the missing calls to the asm functions have been revamped in 891022 NOS and the equivalents (?) are now called "uchtimer" and "chtimer". The big question is, should these calls be put back in to "doshell"?

Any input on this would be greatly appreciated. We would really like to convert everyone over to NOS here, but this one bug is a real show-stopper.

73, and thanks in advance . . . Dave

Well, I for one am ready to help beginners. Since we are all not so fortunate to have 9600 and 56K baud packet units and gunnplexers available to us so easily, we all have to start somewhere, so why don't we start helping those just getting started, and use what we DO have right now! Just because we don't have all digital lines entering into our home doesn't mean we don't use modems to communicate with BBS's and such. Let's not waste what we have, and start helping the beginners. I'll be here to help ANYONE who wants to begin in packet with as much of my limited knowledge as I have (I'm afraid I am

pretty much limited to VHF right now, but I will expand as soon as I have $$$).
Send all mail/net messages to storkus@arrakis.nevada.edu. Sorry, but due to
the UNLV winter break, this offer expires on Thursday night, December 14th, as
I am leaving for home on either the 15th or 16th, and won't be back until mid-
January. That's it for now, 73's, and help someone with something during this
holiday season!!
****

I've let most of the replies to my comment slide, but couldn't pass this
one up.

In its place, JCL is indeed a Good Thing. There are places where an
interactive timesharing system just isn't the right way to do things.

I completely fail to see what that has to do with the need for TCP/IP
systems that don't require a guru to set up.

I got to thinking the other day about Ham Radio and the guys and gals here

in rec.ham-radio.*. With all the talk (by supposed experts) that the majority of Ham's are getting older and that there are severe shortages in the newer generations of Americans coming into the hobby, I started pondering the question of just who WE are in terms of the age distribution.

Since many of the sites on Usenet are academic sites, one can quickly determine that there has to be a certain degree of young adults. But when you start to examine sites that represent companies, and sites that are public access in nature, it gets really hard to tell from that line of thinking. Also, the obvious know-how to operate computers and software is really no solid indication either since it seems that most Hams (young and older) are technical (to some degree) to begin with, and the computer has been mostly more a friend than an enemy. It appears that older Hams have adapted very well to using the computer.

Well, I pondered on it some more (not all at once :-)), and I decided to post this message here. What I would like to do, is to take a quick little survey. The 2 questions are VERY simple. You can just do a direct email reply. Here they are:

1) How old are you?

2) How many years have you been a Ham Radio Ooperator?

I have done no prior investigation on this; this is just some spur of the moment curiosity. What I would like to do is perform some simple (yet informative) statistics on the results I get back and post them back here to the group. I will keep all responses confidential, ie., no one will know who is what age, etc. :-)

I just thought it might be interesting to find out who WE are and to see if the rec.ham-radio.* naturally attracts younger people due to the nature of its underlying environment (the computer net). Some of you may not give a hoot. Well, that is fine. I will be taken up very little public bandwidth (I hope!). But it seems to me that it IS an important question since there are reports that do show (I don't have them here, but recall seeing it before somewhere) Hams as a whole are getting older. If this median we have here is condusive to bringing in today's generation, then we should recognize it as such. I am not attempting to do that now, just get an idea of where we fall.

Any and all reponses welcome! Please use direct email as net bandwidth can be used for better things.

Thanks for your cooperation!

73's,

Mark.

Search for TNC source code.

I would like to do som experimental work with my TNC (MFJ 1278), but
I do not want to start from scratch. Therefore I wonder if I could get
my hands on some source code (in C) which implements the basic AX25.

If this is possible, let me know where to get it by FTP, and let me
also know where to obtain a cross C-compiler hosted by MS-DOS, generating
code for the Z80. If a public domain C-compiler is available, let me
know. It would be nice if I could get that one as well by FTP.

>I take issue with the idea that full duplex is ruled out on 2m. Real full
>duplex isn't often what we're talking about anyway, ...

I disagree. One effective way to do true collision detection on packet radio is for each USER STATION (not just the repeater) to operate in full duplex so it can monitor its own transmissions through the repeater. It compares the incoming data with the buffer it is sending. If there is a collision, it will detect that fact right away so it can abort the transmission before much channel time has been wasted. From everything I've read about Ethernet, it's the collision detection feature that keeps it stable and efficient under even pathological overload conditions. Just getting rid of the hidden terminals certainly helps, but it does not keep collisions from causing congestion collapse under heavy load.

Attaining full duplex on a single band requires duplexers. These are entirely practical for repeaters, since the cost can be amortized over many users. They are definitely not practical for each end user station, especially on 2m.

>>4. The WA4DSY modem runs 5.8 times as fast as the 9600 modem, but for a lot
>>less than 5.8 times the cost! I don't know how the 9600 modem is going to

>allows for true black-box operation.

There is nothing to keep the WA4DSY modem from being used at speeds lower than 56kb/s, say 9600. You just set the clock DIP switches, use different resistor values in the transmit and receive filters (they're all on DIP headers for easy changing), and narrow the receive IF (unstagger the IF tanks and remove the swamping resistor on the output).

Once this is done, it is no more or less difficult to interface to a standard TNC than the TAPR 9600 b/s modem. The required bandwidth also decreases, to a value less than that required by the TAPR and other designs because of the use of coherent MSK modulation.

This is probably my biggest gripe about the TAPR design -- its use of noncoherent FSK. Sure, it's a little cheaper to generate. But it uses more of our most precious shared resource -- spectrum. It's a bit like cutting the cost of a car by getting rid of the catalytic converter. There are external factors to be considered besides cost, and this ought to be considered by any group setting out to establish a widely used, de facto standard.

>>But if you're going to operate on
>>bands above 2m (which, in my opinion, is unsuitable for serious packet radio
>>operation anyway) then the WA4DSY modem is the clear choice.
>
>Until N6GN's FSK 900Mhz and 1200Mhz radios are a done deed. Why would you
>want to run 56kb, when you could run 500kb, or higher? :-)

No argument. I definitely await N6GN's radios with bated breath. But I suspect that there are going to be some serious multipath problems with digital operation much above 100 kb/s over anything but true line-of-sight paths. DARPA packet radio experiments have found this to be the practical limit, and even with spread spectrum (which is much more resistant to multipath) their highest rate is 400 kb/s. You Colorado and California guys may have lots of mountaintops on which to set up your line-of-sight links, but we here on the East Coast have to deal with low rolling hills and tall, dense foliage. And no, my landlord won't let me buy a chain saw. :-)

>And be careful about the phrase "serious packet radio operation". I know
>what you mean, and pretty much agree with you, but you're stomping on raw
>nerve endings... "serious" doesn't always mean fast, or high technology.

I guess I should define what I meant. To me, "serious packet operation" is defined primarily by a willingness to dedicate a radio and antenna to packet instead of sharing one that is ordinarily used for voice. Even at 1200 baud, most existing BBS's and switch sites certainly qualify, as do some users. By this definition, the TAPR radio is clearly aimed at the serious packet operator.

My point is that once you've made this decision, your radio might as well be one that is designed and optimized specifically for packet. There are lots of things you can do that cost little or nothing to do right. Many are already being done in the TAPR project. But first on the list should have been "operation on a band less crowded than 2 meters".

Phil

Regarding the problem with "shelling" out of NOS for long periods of time:

While you're in the subshell, the PC's clock continues to interrupt the system at its usual 18.2 Hz rate and the NOS timer interrupt handler continues to count these ticks. However the NOS code has been suspended so the main timer task (which is woken up by the timer interrupt handler) is unable to process the ticks as they occur. In effect, they "pile up" in the interrupt handler. When you exit the subshell, the timer task wakes up and begins processing the backlog very rapidly. Even if no timers were active, you'll at least see a momentary "freeze" in the system as the timer processes all the ticks. If there were timers active (e.g., the outgoing mail queue was non-empty) all these timeout events will happen very rapidly. This almost certainly explains the behavior you're seeing.

I think I have an idea that'll alleviate this problem. I'll have the timer process give up the CPU each time it processes a tick, even if there are unprocessed ticks left. This should eliminate the momentary "freeze" problem and also avoid triggering all of the timers' completion routines at what is logically the same time.

The difference between the JA and NOS versions is due to my having rewritten the timer interrupt hook between the original NET and NOS versions. The NOS code links itself into a chain of timer interrupt handlers, and there's no need to take it out when going into a subshell; all of the other handlers still get called properly.

Phil

> Correct me IF I'm wrong. Can you not run a DSY modem in full duplex
> mode, WITHOUT a PC/TNC some how?? I suppose you'd still need a method of
> Identification for the FCC.. I confess, I haven't thought this all the way
> through.
Yes indeed. Here in Ottawa we have a full-duplex DSY repeater ready to hit

the airwaves. It receives on 220.55 and retransmits on 433.55. In order to minimize the key-up time, the transmit side of the modem runs continuously and only the external transmit converter is keyed (by the DCD). I designed a little interface board which provides a small FIFO to re-time the received data, a watchdog timer, and a bit of logic to provide a tee connection to a future packet switch.

It works!

> for some time.

I'll add my voice to the appeal. Like Phil, I'm a True Believer in the WA4DSY modem. It would be a real shame if something as useful and as well-engineered as this modem doesn't catch on in a big way. I think some of the reasons it hasn't are psychological, e.g.:

People are a lot more inclined towards plunking down their bucks at their local ham emporium, for a shiny box they can take home with them, than to

send their hard-earned off to a PO Box somewhere.

When you're used to thinking of a modem in terms of a $5 chip in a TNC, the thought of spending $250 on a modem, in kit form no less, takes a little getting used to.

Ditto for spending $250 or more for a transverter, when you can put up a low-speed node using a surplus commercial radio that you got for little or nothing.

My hope is that GRAPES can licence the modem to a company that has some RF smarts, so that they could develop a series of drop-in up-converter and down-converter modules for various bands, that can be housed in the same box. There oughta be some economies involved in making RF modules specifically for the modem, versus separate transverters (relaxed LO stability specs, etc.)

IMHO, the TAPRadio will actually help the process of acceptance of the WA4DSY modem along, by hastening the establishment of 9600 bps as a new standard for end users. If it does well, more people will accept the need for inter-node links at 56 kbs and higher, and manufacturers will see a market for plug 'n play products for these speeds.

Let's make it happen in 1990!

> tries to commercialize a ham product is running into the same thing.

I don't find this at all surprising, or necessarily a Bad Thing. The
vendors no doubt feel that the market for 56kb boxes is relatively small
compared to, say, TNCs, and that it's not worth their while to get in if
they have to carve it up with other vendors. Similar situation with the
PS-186, but that didn't stop SANDPAC from licencing it to AEA. Perhaps a
compromise can be struck, such as making the licence exclusive for only
a limited period of time, such as a year. Throw in a few other provisos,
e.g., that the licence is revoked if the product doesn't materialize
within a certain time span, and that GRAPES retains the rights to sell
modem kits to individual experimenters. I firmly believe that with 9.6kb
gear and fast switch hardware becoming readily available, somebody will
wanna grab that 56kb carrot.

Hardly. IN this case, all I want is to be able to hand someone a disk,
tell them to RTFM, and be confident that they'll be able to get it on
the air without a lot of hacking.

Curious, it's in use as a production program in a great many places, with
quite satisfactory results. For example, this message is coming to you
courtesy of our homebrew terminal server, running a peculiar mixture of
Unix V7 and a positively antediluvian KA9Q. It has flaws, but it gets
the bytes through.

Hello,

I am trying to build a list of those persons developing, porting, and/or
using Phil's KA9Q package on Unix/Xenix. Since installing the system(s)
on Unix introduces portability difficulties when going to a different
version of Unix (like Ultrix), I would like to know those of us that are
involved with the Unix end of things and KA9Q. Please email a simple
response, and if you would, what Unix/Xenix version you work with, and
what version on Phil's package you are working with.

Down the road, I may implement a mailing list on my system of KA9Q
Unix/Xenix people for faster collaboration on porting woes.

Thanks in advance for your cooperation!

Mark.

Hello All,

Does anyone know of and/or have a package that works like the PAKRATT
program (MSDOS) that interface with a PK-232 to make controlling it
much nicer?

Any info would be greatly appreciated.

Thanks in advance.

I have some observations from a few days of running the PC version of
871225.33.PE1CHL.890814. WD6EHR may have some comments to add, as he

has been running essentially the same program, for the ATARI, longer
than I.

Disadvantages of PE1CHL NET:

1. No ax25 mailbox
2. No netrom verbose off (but get around it by using netrom tcpip normal,
   to turn off broadcast of non #ip nodes)
3. No smtp trace function (really miss this one).

Advantages:

1. No finger format bug
2. Control blocks back to 4 chars (hooray!)
3. Temp files erased
4. Record <filename> works with ftp & finger sessions
5. Trace to <filename> works
6. Source command reads separate commands file
7. MHeard function expanded
8. AX25 callsign handling allows different SSID on different
    interfaces
9. Digipeater function enhanced for gatewaying
10. Flow command implemented: incoming input not printed when user
    is typing on an interactive connection.
11. AX25 port command added to allow ax25 servers.
    KB6CUN-0 = normal keyboard->keyboard connects (yawn)
                (2m or 220)
    KB6CUN-5 = NetDigi 2m->220
    KB6CUN-6 = NetDigi 220->2m
    KB6CUN-7 = MHeard server, 2m or 220
    KB6CUN-8 = Conference bridge #1
    KB6CUN-9 = Conference bridge #2
                  the conference bridges allow multiple users a
                  roundtable qso, with some interactive commands:
                   //connect call [interface]
                   //disconnect call [interface]
                   //interface (prints a list of interfaces--mine are 2m
                               & 220)
                   //mheard [interface] sends mheard list of specified
                     interface, or defaults to interface of connection
                   //users
                   ///any text: passes //any text to users
12. RCMD server: This looks very interesting & powerful--allows a user
     complete control of NET remotely, supposedly.

I had stated previously that the inability to address the COMport
hardware directly, with the attach command, was undesirable; I have
had to wean myself from interrupt-hungry programs like Symphony and
SideKick Plus, in order to load the interrupt handler MBBIOS and have
NET work.
The version of NET I was running before this was 890421.1.

A ETransfer aborted by otherside._
I have been experiencing yet another problem with my MFJ 1278 - I
wonder if anyone has any suggestions.   I run the MFJ in KISS mode
while running NET. It seems after running for some time the unit
pops out of kiss mode for no apparrent reason. I can't seem to figure
out what immediately precedes this; it happens sometimes 2
minutes after being reset and sometimes days after. I thought maybe
it was a transient power supply voltage drop, so I have the thing hooked
up to an external supply that I know doesn't fluxuate. I thought maybe the
lithium battery was weak, so I have two Duracells supplying the 3 volts
backup.

Anyone have any hints or suggestions?

Thanks in advance,   Joseph Skoler, skohc@cunyvm,   kc2yu

Hello out there. I just read a brief note about a sort of callsign database,
I think it was something like "marvin.cs.buffalo.edu". I am new to this list,
so would anybody be so kind and send me information about this service?
Thank you.

I am running Phil's TCP/IP package version 890421.1 on a 16 Mhz 386 system using Microport V/386 3.0eU. I use it for interconnecting my Unix and Messy-DOS machine and it performs very well.

Can anybody please send me notes about how to calculate the Frame Check
Sequence (FCS), a sixetten bit number calculated by both the sender
and receiver of packet frames, please.
It is a cyclic redundancy check, calculated in accordance with ISO 3309
(HDLC) recommendations. Trouble is that I don't know how to calculate it !
Thanks,

But of course we know the modem is the most important part, besides the radio.

> Ditto for spending $250 or more for a transverter, when you can put up a
> low-speed node using a surplus commercial radio that you got for little or
> nothing.

But you can convert many radios to transverters by retuning and removing most
of the I.F. strips, right?

> Has anyone used the pac-comm 9600 baud modems?
>
> I was interested in how easy it is/isn't to hook it up to a radio?

There is an article in the latest (Dec 89) 73 Mag which gives some details on the interfacing requirements. Speaking of which, does anyone else find it rather tacky that an article about a Pac-Comm modem, written by two *employees* (part-time, anyway) of Pac-Comm, is labelled prominently as a "review"?

The ad is for the Megadata card, which covers 408-470 MHz. It doesn't
include a price. The Arlan card for 902-908 (Part 15, unlike Megadata
which claims 15 mile range) costs $1500.

Not having the guts to call them, is Megadata higher or lower than
Arlan?

Still, the idea's right, the price isn't.

Here is info on the latest version of DOSGATE:

The current version of the DOSGATE driver *should* now support most any TNC. The previous version only worked well with Kantronix TNC's.

DOSGATE allows a PC (XT, AT, compatibles too) to be used from a remote packet terminal. This allows *almost* any MS-DOS program that is available on the disk drives to be run from the remote packet terminal.

"*Almost* any" does not include programs that bypass MS-DOS function calls for terminal I/O, or (because of limitations of the remote packet users) programs that require graphics, etc.

DOSGATE installs as a 'device' driver in place of the standard ANSI.SYS driver, although (at this time) is does not support ANSI escape sequences.

DOSGATE has been tested with Kantronix, and AEA TNC's at this time. Hopefully more will be added to this list as users send me reports (Sorry, I can't afford to own one of each type of TNC!).

What can DOSGATE do for you? Just about anything that you can think of, and have/write the software for.... controlling things in your shack, allowing access to a telephone modem, compiling programs, etc.

My DOSGATE system (NM1D-2 on 145.070 in Derry, NH accesable through node SNH) has the following applications available to users via the packet network (users include regular checkins from Canada to Arkansas):

SeeSats - Real time OSCAR tracking
AutoExam - Online Ham radio exams from Novice to Extra, can be used interactivly or to print out written exams, full question pools, each exam is randomly different.

AutoCall - Online callbook database (kudos to N7IKQ), look up any call in the US (currenly limited by disk space to

the W1 call area, should contain entire US by December).

Games - Several INFOCOM 'adventure' style games that can be played on-line.

Repeater database - Repeaters in the New England area which can be searched by frequency, Town, State, etc.

Club database - Local radio club member database can be searched by name, call, address, town, state, etc.

DOSMAIL - SIMPLE (local only, no autoforwading at this time) mail system that works similar to other packet BBS's.

Misc - Several other databases, and programs too numerous to mention here.

How to get DOSGATE for your area:

There is NO COST for the DOSGATE software if you use it for Amateur Radio on-the-air applications. To get a copy send the following to me:

1 Formatted 5 1/4 inch 360K floppy diskette
1 Self-addressed, STAMPED diskette mailer to allow me to return your disk to you.
Your Name and Address
Your request for DOSGATE.

Send to:

Rich Bono
7 Redfield Circle
Derry, NH 03038

If you forget to include any of the above items, then your disk will probably not be returned to you!!!

DOSGATE is not available via electronic transfer...

YES!!! Packet can be used for MUCH more than just email!!!

DOSGATE allows you to easily write your own programs and not have to worry about the program to TNC interface.
Support a DOSGATE in your local area.....

Rich (NM1D)

I wish it were true. The G3RUH/TAPR- type modems contain significant DC components. The DSY modem's MSK modulation contains much less but still some. This means that the sections of the radio that handle the modulation (the whole radio, in the case of DSY) must be linear. That means that Class C radios such as most all commercial land mobile radios, won't work. When I first heard of Dale's work, I held high hopes that ordinary radios could be tapped at the IF stage on receive and modulated or mixed in the transmitter to be used. Proved not to be the case.

BUT! There is no reason linear transverter hardware cannot be made available as cheaply as most surplus gear. After all, there is no synthesizer and little IF involved. The Microwave Modules transverter, with its all-descrete design hand-built construction, is a very poor cost model to use for reference. I hope that some of the RF geniuses that populate this newsgroup will work up a nice little transverter design in their spare time :-)

I made up a version of the DSY ROM that has no amplitude modulation components,
and that (should) work just fine class C. I have sent it to a few people for
testing. It is compatible with standard DSY modems (in that both should
interoperate). If there are not too many people who want it, I will mail
copies of a C program that generates the rom code.

But of course we know the modem is the most important part, besides the radio.

> Ditto for spending $250 or more for a transverter, when you can put up a
> low-speed node using a surplus commercial radio that you got for little or
> nothing.

But you can convert many radios to transverters by retuning and removing most
of the I.F. strips, right?

   Probably not unless they generate an LO and mix directly to the output
frequency instead of multiply. Also you may need linear gain instead of
class C for most interesting applications. The DSY modems as nominally used
have a couple of dB of AM on them.

Has anyone out 'there' used/interfaced amateur packet TNC's to a broad-

band LAN?? A shared interconnect service would then be possible at speeds up to 9600 B, with the proper modem and rf strip.. The question is, would it be any cheaper to implement than other commercial products which give you async point-to-point communications? It would be an addressable system.. I think you'd want to make darn sure whatever you hung on the network was spectrally CLEAN! I have a non-profit application for such a service..

Pat.davis@mail.admin.wisc.edu 128.104.198.10

P.S. Has anyone done any remote control/telemetry with such equipment over a broadband LAN??

P.P.S. Is there another forum better suited for such a question? (I doubt it).

I am interested in the potential applicability of the CSMA/CA (Carrier Sense Multiple Access with Collision Avoidance) protocol to amateur packet radio. In particular, I am curious about its potential in a hidden terminal environment.

CSMA/CA works like this:

1. A station wishing to transmit first executes a fairly standard p-persistence routine that introduces a random delay.

2. The station sends a short Request to Send (RTS) packet to the destination.

3. The receiving station returns a Clear to Send (CTS) packet to the sender.

4. The sender sends the actual data packet(s).

The idea is that collisions should happen only to the RTS packets, which are relatively short. If a sender doesn't get a CTS in response to its RTS in a specified interval, it waits for a random period and tries again. Stations overhearing a RTS message directed at someone else are required to defer long enough for the intended receiver to return a CTS message, and stations hearing CTS packets are required to defer to the sending station until it has finished sending its data.

What makes this technique potentially valuable for packet radio is that it may offer another solution to the hidden-terminal problem. Given reasonable signal strength reciprocity, stations that might interfere with a sender they cannot hear would be alerted to its presence by hearing the receiver's CTS packet. If the length of the data to be sent is included in the RTS packet and echoed in the CTS packet, then stations hearing the CTS will know how long to stay off the channel. Again assuming reciprocity, a station hearing RTS but not CTS would not have to defer beyond the CTS response window since it would most likely not interfere with the distant receiver. This would maximize spatial reuse of the channel.

You can think of this approach as similar to Busy Tone Multiple Access (BTMA) except that the receiver's busy "tone" (the CTS message) is time-division-multiplexed onto the data channel as a packet. Or, in more conventional ham radio terms, the CTS message means "the frequency's in use, old man". :-)

The big drawback, of course, is the overhead of the RTS/CTS exchange. If a data transmission is sufficiently long then overhead isn't a big deal, but if the RTS/CTS exchange has to be done even for short packets then the overhead could be as much as three times. Obviously there is some transmission size below which it would be quicker just to send the data packet without the RTS/CTS handshaking and take the chance that it'll collide. (You would still have to defer to RTS/CTS packets from other stations, of course.)

Has anybody done any analyses or simulations of this protocol? I'm particularly interested on the effect of modem turnaround time on overhead. If the standard CSMA/CD formulas are any guide, it appears that for WA4DSY modems with turnaround times of 15ms, the data packets should be larger than about 700 bytes for the resulting efficiency to exceed that of slotted Aloha. It may turn out that this technique would be practical only for FTP/TCP/IP transfers with large window sizes.

Comments?

>mixed in the transmitter to be used. Proved not to be the case.

I think John's a little confused here.

As far as baseband DC components go, the WA4DSY and G3RUH modem signals look very much alike -- both use scramblers but no other forms of baseband encoding, e.g., Manchester encoding. Thanks to the scramblers, neither modem has any discrete lines in their baseband spectra, but they both still have spectral density peaks at DC. The low frequency signal components cause some "baseline wander" if you AC couple them as in the two 9600 baud designs, but a very clever "commutating slicer" in the WA4DSY modem sets a slicing threshold that depends only on the mark and space voltages -- not the short term DC average.

As far as the RF envelopes go, it is true that the WA4DSY modulator was intended for a linear transverter/amplifier chain while the 9600 baud designs can work with Class C amplifiers. However, the WA4DSY linearity requirement is due to Dale's use of a modified form of MSK that produces a non-constant RF envelope amplitude. Classical MSK produces a constant envelope signal that can be amplified in a Class C amplifier.

The WA4DSY modulator *will* work just fine through a nonlinear amplifier, but the signal bandwidth will increase somewhat. You can see this effect when adjusting a modem on a spectrum analyzer. When you drive a Microwave Modules transverter beyond 10 watts average output, the near-in sidelobes come up noticeably on the analyzer, though they are still down at least 20 dB. Even with a nonlinear amplifier, however, I suspect the bandwidth occupied by the WA4DSY modem is still less than a G3RUH/K9NG modem operating at the same speed. (The coherent modulation method used by WA4DSY is inherently cleaner than the noncoherent G3RUH/K9NG method.)

The precise characteristics of the WA4DSY modulator, including the RF envelope shape, can be changed by simply changing the waveform tables in the transmit encoder EPROM. Some time ago Marc Kaufman, WB6ECE, experimented with them with the goal of minimizing the bandwidth of a constant-envelope signal. It's been a while since he did this so I don't remember his results; hopefully he can fill us in here.

Standard FM receivers *can* be used to feed WA4DSY demodulators, as long as the IFs are compatible and the receiver bandwidth ahead of the tap-off point can be made wide enough. The WA4DSY demodulator's first internal IF is 10.7 MHz, which is common enough. Since most FM voice receivers place the bulk of their selectivity at the 2nd IF (typ 455 KHz), tapping the signal is relatively straightforward.

Some form of mixing (as opposed to frequency multiplication) is still required for the modulator, though, as multiplying the MSK signal would multiply its modulation index -- it would no longer be "minimum" shift keying. But low-level linear mixing is no big deal, and if nonlinear amplifiers could be used at the higher levels the system could be made quite inexpensive.

Ben, your best bet is to see my review in the October issue of 73 Magazine. It contains several diagrams that help illustrate the design of the modem that would be difficult to reproduce here (although it might be possible to post postscript versions.)

I coordinate, or try to coordinate, the Unix versions of the KA9Q
TCP/IP package. The latest version I have assembled is available
with anonymous FTP to host vax.cs.pitt.edu in the file
pub/ka9q/net-unix.cpio.Z. It is a bug-fixed version 890421.1. Had
there been an 890421.2, this would have been the starting point.
This version is known to run on the following systems:

     -- Vax 4.3bsd
     -- Sun-3 SunOS 4.0.1, Sys V emulation
     -- AT&T 3B2 Sys V rel 3.0
     -- AT&T 7300 OS version 3.5
     -- Convergent Tech Miniframe

I have linted this version as much as I can to remove any potential
portability problems and have incorporated many of the fixes supplied
by Microport and Xenix users. I don't have access to an 80x86 version
of Unix, so I would appreciate hearing of any problems experienced
by people trying to compile and run this package. My goal is to have
one set of sources that can be compiled and run anywhere.

I also have a copy of the Unix version of NOS that was done by
Anders Klemets (klemets@sics.se). I plan to make this the basis of
future versions of the KA9Q package on Unix.

In the past few days, a few people have sent some messages to the wrong
address. As a result, the messages get directly sent to all people
subscribed on the BITNET redistribution of the list, but doesn't get
included in the packet-radio digest. That means that instead of receiving
a clean digest about once a day, I get many short messages. This is irritating.

So may I remind all of you networkers, that the address to send messages to is:

On INTERNET: packet-radio@mil.army.wsmr-simtel20

  ^^^
> existing ground-based PBBS network. (The standard PACSAT protocols will
> also be implemented on the AMSAT-NA Microsats, although not using
> 9600-bit/sec PSK modulation.)
              ^^^
This is an error. There is, as far as I know, no 9600 bps *PSK* modem from
G3RUH. UoSAT D and E will use 9600 bps *FSK* on both uplink and downlink.
The required modem should really be termed "K9NG compatible", since Steve
Goode, K9NG, established the de facto standard for 9600 bps FSK modems used
in amateur packet service.

Picky, picky, picky...   :-)

In general, I don't think telephone BBS & modem technology transfers
very well to Packet Radio. There is one idea, however, that makes a
lot of sense to me. When OPUS, FIDO, QuickBBS, etc swap their
conferences, they pack the messages into a file and run a data
compression program on it.

This process reduces the size of the file by more than 50% and saves
telephone charges. Why can't packet BBS systems do the same? There
are several good data compression programs out there, some public
domain. Also, there are file transfer protocalls that will work in a
packet environment.

Halving the size of the transfers will improve the throughput by at
least a factor of 2, and probably more by reducing collisions and
congestion.

In addition, a compressed file is no more a "secret code" than ASCII,
and the beaurocrats, if they notice, should not get upset.

(Relpies to CLINTON.EVANS@CANREMOTE.UUCP.)

In article <1291@dgbt.uucp> barry@dgbt.uucp (Barry Mclarnon DGBT/DIP) writes:
>
>I don't find this at all surprising, or necessarily a Bad Thing. The
>vendors no doubt feel that the market for 56kb boxes is relatively small
>compared to, say, TNCs, and that it's not worth their while to get in if
>they have to carve it up with other vendors. Similar situation with the
>PS-186, but that didn't stop SANDPAC from licencing it to AEA.

But Barry, The AEA/PS186 is the best example I've seen so far for NOT giving exclusive license! This mythical, magical board is becomming the biggest vaporware joke since VisiOn! I'm not picking on SANDPAC, I'm shooting squarely at AEA.

I am one of the most feverent believers in source code for software and multiple sources for hardware. A major reason I keep shooting at that moving target called NET is because it is non-proprietary.

Consider the benefits of non-proprietary designs. Packet radio exists for most people today because the TAPR folks established a hardware AND a software standard with the TNC-x series. And aside from plug'n'play interchangability between brands of TNC-2 clones, the competative pressure of the market has kept them affordable. Two perfect examples using the TNC-2 as a reference at a typical price of $120.00:

Example A) The heathkit pocket tnc at about $200 retail. Here is a TNC that contains fewer components, uses the Z80 superintegration block and a single chip modem, is designed for automatic construction and yet costs TWICE that of the TNC-2 clones.

Example B) The PK-232 at over $300.00 retail. Here is a unit that contains only marginally more components than the TNC-2 and yet costs THREE TIMES that of the TNC-2. And because AEA has chosen to "improve" the command set, it is incompatable with the TNC-2 standard which really complicates things.

What really confounds me is that the vendors want proprietary rights in

the first place. The benefits of ham-engineered products are many.
NRE costs are almost non-existent. THey are handed a fully production-
engineered product that only needs packaging and distribution. THe existence
of a standard with multiple sources creates a synergistic condition that
enhances the market potential. So why do they have to have exclusives?
I think it is the god syndrom.

I'll repeat my message of an earlier post. If people really want
affordable, non-proprietary packet components such as the DSY modem,
then put the pressure on the vendors. Tell them to kill the NIH stuff
and go with the proven standards.

John

Version 2.8 of the AA4RE BB program is now available.

The primary advantage of BB over the MBL/RLI/BQE/CBBS.... systems is the
ability to handle multiple connects per port. The program uses it own
multitasker and no DesqView, DoubleDos, etc is required. On the down
side, BB has been optimized for speed but requires at least 512K (and
usually 640K) to be used productively.

You can get this program by sending a $5 US (or equivalent) to:

 Frank McPherson KB7TV
 4102 E. Lavender Lane
 Phoenix, Az. 85044
 (602) 759-1854

N7IJI in Charlotte, NC is also distributing the software. Contact him
at N7IJI @ N7IJI.NC.USA.NA on how to obtain a copy.

The software can also be obtained by downloading from the following BBS:

   WA6RDH BBS at 916-678-1535 (300/1200/2400/4800/9600 N81)

Those with FTP Internet service or BITNET should send a note to AA4RE @ AA4RE.#NOCAL.CA.USA.NA with your TCPIP address (eg. 123.213.22.33) or BITNET address for delivery over those networks.

The software should be available from TAPR after 12/15. Send orders to: TAPR - Box 12925 - Tucson AZ - 85732

New features:

- -- Added new port type -- G8BPQ_NODE. Use version 3.51 or higher of the G8BPQ program.
- -- Add ability to execute DOS program from WAKEUP or Keyboard
- -- Added new search args for K R and EXPORT commands. Now similar to the "L" command
- -- Added "R" option.. LATER and REJECT support
- -- Added support for multiple BBS with same call
- -- Added White Pages support (EW command)
- -- Added GN command to change file names while running
- -- Added NO_BUSY_FWD in PARMS.BB -- It prevents a forward cycle if port is busy. Intended for HF where you only want one connect.
- -- Added $7, $8, $9 to MESSAGEs. Each sounds a different tone. This is primarily for blind SYSOPs.

In addition, the following programs are available

BB28DOC -- N4CHV's DOC file for BB
BBUTL12 -- KL7GNG's BB utility package including Log File Analyzer
QBBS -- KL7GNG's Satellite tracker server for BBS

Please correspond directly with the authors if you have questions, comments, or problems with these files.

In addition, I have tested N2MH's header parser and it works nice. This program updates your HLOOKUP.BB file based on incoming messages. Contact him directly (N2MH @ N2MH.NY.USA.NA) for version 68.

>Has anybody done any analyses or simulations of this protocol? I'm
>particularly interested on the effect of modem turnaround time on
>overhead. If the standard CSMA/CD formulas are any guide, it appears

There is in fact a big problem of those BTMA full-duplex nodes
(occupying 2 frequencies): still dealing with p-persistance controll.
p-persistance is a nice cookie at a first view. On the other hand it
adds delay, so it reduces throuput of a channel.

For example: assume a VHF/UHF-TRX has a turnaround time
(station is dead, no receiving, no carrier available to
other stations) of about 100 msec (which is a fairly good value
nowadays, I measured some devices of up to 250 msec) and a minimum
size frame of about 20 byte (similar to RR#-frames). This frames will
take about 150 msec (at least) at 1200 bps to xmit.

But

if one decided to manage channel access by means of p-persistance
and will controll 5 concurrently operating stations the slottime of
p-persitance has to be multiples of the turn-around-time.
This will bring a statistical maximum delay of 500 msec per turn-around
(in the above example) or an average delay of 250 msec.
Which isn't a very usable delay to xmit a 150 msec frame.
When turning over to higher data-rates this relation becomes even
worse, because turn-around-time doesn't drop in the same
way as the data rate increases.

So I feel a method that increases the amount of p-persistance delays
is only one way we might go.

I'd prefer another way that reduces (p-persistance) delays to maximize
throuput of a channel.
This could be managed by a centralized station by means of a DAMA
methode (which is described in the previous proceedings of the digital
comitee meeting). DAMA won't need any additional intended delay.
And an intelligent scheduling algorithm will reduce arbitration
overhead to a minimum. Additionly the overhead will decrease if
channel load is going to increase.

Detlef (dk4eg)

I agree with you 100%. Unfortunately, the Not Invented Here syndrome
permeates most markets having to do with computers. However, packet
radio controller vendors proved once already that they are capable of
meeting market demands. I think the inclusion of KISS mode support
in their firmware is a good example of this. Another good example is
the addition of mailbox features. (but not SMTP compatible :-( )

If the vendors do business according to the philosophies of exclusivity
and NIH, they limit the growth of their own market. But then, this
is common sense, isn't it?

The packet controller vendors need to be told what the marketplace
wants and if the demand is there, they will probably put aside the
NIH biases. (We want it compatible, we want it fast, we want it NOW
and we want it CHEAP. :-)

Not being a programmer, I am wondering how hard it would be to call an external viewer from BM?? Beurg's popular LIST program comes to mind. I use LIST now against the xxxxx.txt files in \spool\mail. The thing with that is that you can't point-and-shoot at the various mail items for selective viewing.. If you could call LIST to view that text which resides between pointers which delimit mail items, you'd (I'd) have it made.. LIST is kinda nice since it lets you save chunks of a LISTed file to another file e.g., a text file.. It allows FWD/reverse scrolling, keyword searches, hex dumps and MANY other things..

I was thinking that since Bdale allowed US to call an external editor, why not a viewer?? (Whaddaguy Bdale!)

FYI, my friend Bryan, N9GBJ has allowed me to post release 1.0 of FIXMAIL for use with files created/handled by Bmailer. FIXMAIL is a handy utility for managing mail, especially mail for people who don't

get on alot (and end up clogging your mail queue). I have NOT used it
yet, but have perused the DOC file and of course chatted with Bryan
about the program.. From everything I'm told, EVERYONE should have
this.

Bryan, N9gbj has written a preliminary DOC file and has graciously
supplied the .C code for the program along with the .EXE file. As I
write this, I am FTPing FIXMAIL to: pgd.adp.wisc.edu 128.104.198.22 .
Interested parties should be able to GET Fixmail from \PUBLIC
on pgd.adp.wisc.edu via Anonymous FTP.
If it is "worthy", somone can PUT it on FLASH, or Hp.xx.xx.com ..

Postive, upbeat comments (kudos) can be sent to:
bryan%n9gbj@pgd.adp.wisc.edu 128.104.198.22 .. If there's somthing
you don't like about FIXMAIL, maybe intimate it on a forum first, and
see if anyone has a similar problem.. Like many programmers I know,
Bryan DOES work for a living and MUST concentrate the bulk of his
efforts on making a living..

FIXMAIL.ZIP is stored under PKZ102, Paul Katz's file compression utility.
If you do NOT have PKZ102.exe, you'll find it on PGD as well.
PKZ102.exe is a self-extracting ZIP file. I'd run it the first time in
it's OWN subdirectory, as it will expand out into 10-20 files!
PKZIP is Shareware, as in you like it, you send him some nominal
registration fee.. (I don't wanna get flamed by Katz).

I am using the 891108A version of NOS. How do I access the AX25 mailbox?
A few versions back, I was able to Connect to the IP node, and it would
come back with prompts. Now it no longer does that. I have MBOX ON

ka9q:3. The receiving station returns a Clear to Send (CTS) packet to the
ka9q:sender.

dk4eg:after it executed another p-persistance routine |?

No. The p-persistence algorithm is invoked only before the original RTS
packet is sent. Once you've begun the RTS/CTS/data "dialog" (to use the
Apple Localtalk term) you use small, fixed delays between the frames.

DK4EG:I'd prefer another way that reduces (p-persistance) delays to maximize
DK4EG:throuput of a channel.
DK4EG:This could be managed by a centralized station by means of a DAMA
DK4EG:methode...

The idea behind a scheme like CSMA/CA is precisely to avoid a
centralized node. Not that the centralized schemes don't work, but they
are vulnerable to failure of the node and I wanted to explore schemes
that are more "survivable", as the military puts it.

I assume you are referring to the 8-bit PID field in the AX.25 Level 2
protocol header. Here are several defined values that are currently
in use:

80 - Level 2 segmentation/reassembly protocol
C3 - TEXNET Network Layer Protocol
CC - DoD Internet Protocol (IP)
CD - DoD Address Resolution Protocol (ARP)
CF - Net/Rom Network Layer Protocol
F0 - no upper layer protocol, send data directly to terminal

I should have said that I used the Portable Plus with it's internal modem
at 1200 baud. The Multitech was used with the Vectra ES/12 (AT clone) at
2400 baud. The routines have *not* been tested at higher baud rates.

(This testing was performed before I modified my Portable Plus to run at
8 MHz with a V30 in place of the Harris 80C86 at 5.33 MHz. I have not
checked the dialing routines with the V30, but I'd expect the operation to
be without problem.)

>was sort of helpful, I still wasn't able to come up with an attach command
>that would make anything good happen with my modem. Could someone who
>knows this stuff please post a mini-tutorial on making it work?

I wrote the dialing routines. Here is the manual entry as it should
have appeared. I've used it to dial the call-back system at HP here in
Corvallis without difficulty. The computer was the Portable Plus. The
modem was a MultiTech 224E.

I've also used it, to test out the standard PC version, using the following
attach command:

```
attach asy 0x3f8 4 slip sl0 2048 256 2400 - ATX1DTxxxxxxxxxxxxxx;\r OK
\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\dATDTxxxxxxxxxxxxxx;\r OK \d\d\dATH\r RING
\dATDT*\r "CONNECT 2400" \d\d\r IRED? \d\r IRED? \dx\dx\dx\dx\r GO \d\r IRED?
\dx\dx\dx\dx\dx\dx\r\d\d\d\N\Nx\d ogin24: \dxxxxx\r assword: xxxxxxxxxxxxxxxx\r
```

Where:

```
attach asy 0x3f8 4 slip sl0 2048 256 2400 --- Standard attach command
-                         --- Use debug mode
ATX1DTxxxxxxxxxxxxxx;\r           --- Dial the number
OK                        --- Wait for an 'OK' from modem
```

```
\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\d\dATDTxxxxxxxxxxxxxx;\r --- Wait several
                            seconds than send access code
OK                        --- Wait for OK from modem
\d\d\dATH\r                    --- Hang up modem
RING                      --- Wait for modem to indicate RING
\dATDT*\r                      --- Modem command to answer phone
"CONNECT 2400"                      --- Wait for connect indication
\d\d\r                         --- Wait a couple of secs and send CR
                            To announce our presence
IRED?                          --- Expected string from system
\d\r                           --- Do it again to
IRED?                          ---   ensure we're in sync
\dx\dx\dx\dx\r                      --- Access correct port
GO                        --- Wait for go ahead from system
\d\r                      --- Let second system know we're here
IRED?                          --- Wait for response
\dx\dx\dx\dx\dx\dx\r\d\d\d\N\Nx\d      --- Select correct port and announce
                            our presence
ogin24:                        --- Wait for login prompt
\dxxxxx\r                 --- Send our account name
assword:                  --- Wait for password prompt
xxxxxxxxxxxxxxxxx\r                 --- Send password and we're on
```

The account I used automatically scheduled 'net', so at this time the two systems were ready to go. Crude, but functional.

=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=

7.3.5.2. SLIP Modem Dialing

An extension to the attach command allows the syntax:

```
attach <hw type> <I/O address> <vector> <mode> <label> <bufsiz> <mtu>
  [<speed>] [[optional '-' for  debug]  <send>  <expect>  <send> [...]]
```

for slip connections only. The send/expect sequences allow you to dial a modem on the slip port, and negotiate a remote login to setup a slip link.

\d	- delay 1 second		
\n	- send newline	\t	- send TAB character
\r	- send carriagedreturn	\N	- send a NULL (0x000)
\E	- send control-D	\s	- send space
\\	- send backslash	\b	- send backspace

Note that an expect does not have to follow the last send. Those familiar with UUCP will recognize the expect/send paradigm as being similar to that used in the L.sys or Systems file.

>Yours in eternal (well, at least till next Thursday :-) gratitude...

Think nothing of it....

I have gotten ka9q tcp/ip compiled and installed on a Xenix 286
system. It took quite a bit of playing with flags, fixing msgget
problem (as mentioned earlier) and a couple of beers.

I have run into a situation, though, that has me buffalo'ed. I have
hooked my bbs software (uNET - a RLI, etc compatible) into net instead
of XOBBS. It was a problem and still is. Everything would work fine
until I did an execl. The exec would fail. After trying everything
I came up with:

```
  if(execl("unet.tcp","unet.tcp",arg1,arg2,arg3,arg4,arg5,0) < 0) {
          ....
```

this works in the mbx_state(axp,old,new) function. It should not,
according to the manual which states that I must have the complete
path in the first string. Every book states that. I am doing it in
the home directory, so I was not too concerned.

But, neither the above command, or the one done as shown by all manuals
will work in ANY of the other execl calls. I get a bad exec on both
the forwarder and nr4in call. I have tried everything I can imagine. I
forced each part of the statement to their respective cast [like
(char *)"unet.tcp"] to no avail. The variable errno return an error
14, as it did with the one that now works in mbx_state.

Any one have any advice?

> I don't think that this is a good idea. If you lower your power, you will
> increase the hidden-terminal problem.

Yes but you are not supposed to lower only the power. You must also decrease
the sensitivity of the receiver!

If both stations lower both their power and sensitivity then they will need

to use more power than if they used maximum sensitivity, obviously.
But this will lessen the hidden-terminal problem.

There are two ranges to handle: the transmission range and the carrier
detection range. There is a paper where it is discussed whether the
transmission range should be greater than the carrier dection range or not
in conjunction with special routing algorithms.

The paper is by Jens Zander SM5HEV and is called "Carrier detection range
control in multihop packet radio networks", published in the proceedings
of EUROCON 88. I might be able to arrange paper or machine readable
copies of it if anyone is interested.
See also "Design considerations of a distributed packet radio network
using the radio amateur band" by Persson and Forchheimer, Linkoping
University 1980.
I have also seen references to "Transmission range control in multihop
packet radio networks" by Hou and Li in IEEE Transactions on Communications,
January 1986 and
"Optimal transmission range control for randomly distributed packet radio
terminals" by Takagi and Kleinrock, IEEE Trans. on Comm., March 1984.

I down loaded the 890421.1 software from Howard's (wb3ffv) ham bbs on the
weekend. It compiled on my sysV.2 system without trouble. I'll try it
on my home V.3 system in a few days. Read the blurb in rec.ham.radio on
how to access the wb3ffv machine. The files are in

/usr/bbs/ham/ka9q/net_src.arc
(although its in arc ed format, it has BSD V.2 and V.3 sources + PC, amiga etc)

/usr/bbs/ham/ka9q/net_doc.arc
(the documentation (all 100 pages). (pitty its not in troff format!)).

Does anyone know what the latest ROM level is for the MFJ 1270 TNC-2?
I just picked one up at our club auction and I want to make sure that
it is up-to-date. Does MFJ still support this older model?

Any comments would be appreciated,

HI FOLKS:

I AM NEW TO PACKET AND DO NOT KNOW TOO MUCH ABOUT WHAT IS OUT AND AVAILABLE
FOR A NEWCOMER. I WILL BE USING A ZENITH 286 MACHINE FOR PACKET AND I
WAS WONDERING IF SOME OF YOU ALL MIGHT BE ABLE TO OFFER TIPS ON REASONABLY
PRICED TNCS AND PACKET SOFTWARE (FOR MS-DOS) THAT I MIGHT BE ABLE TO
USE. I AM A "POOR" COLLEGE STUDENT AND AS SUCH CANNOT AFFORD TOO MUCH.

ALSO, HAS ANYONE HAD ANY EXPERIENCES WITH BOARDS THAT COMBINE PACKET, A
MODEM AND A FAX ALL IN ONE FOR PCS AND COMPATIBLES? MAYBE THIS IS A WAY
I COULD GO??

THANKS A LOT,

FEROZ GHOUSE, 4S7FG/N9FJL

I just got version 1.2.6 from MFJ a few weeks ago. It supports mailbox
and KISS modes. It requires 32K of RAM. I got both from MFJ for about
$40. Release date is 1988, however, and I've seen others with mailboxes
that seem different, so I'm not sure if its the latest in the TNC-2
style ROMs. The documentation is full of typos, so if you get a copy of
that, beware.

Is there a user of TNC220/PACCOM in this list? I would like to have
a contact with him for a discussion and possible modifications of this
TNC.

Question:

Is there a way to find out somebody's call sign if you know their name?

I don't know if Buckmasters (tm) can do it, and even if they could, I don't need the service bad enough to spend the Bucks they want. There must be a database somewhere else that hams can access and do searches on. I see people looking for lost ham buddies all the time. In my case, it is a lost relative.

It would even be nicer to find out all the hams in a given area or to find the call of a ham at a given address. The call book is fine for finding the information if you know the call.

I wonder if the FCC has a complete set of files they sell. Maybe there's a need here that can be filled by a cheap "inexpensive" service.
Anybody want to go into business? :-) Maybe the packet networks could have this service incorporated into it.

Thanks,

  Chuck Rissmeyer (KE0VG) | All ideas are mine alone!

The Internet callsign server on marvin.cs.buffalo.edu allows search by call,
search by last name and search by city. See the message I posted a few days
ago for how to access the system. If you're not on the Internet send me as
much info as you can and I'll try to track them down and mail you the results.

IMMEDIATE RELEASE

TO: ALL@ALLBBS
FROM:N2DSY@KD6TH
BID: $0811_ROSES
SUBJECT: ROSES-1 Event Schedule

11 November 1989

ROSES-1 Schedule of Events

As of 28 October 1989

The New Jersey Institute of Technology Amateur Radio Club and
the Radio Amateur Telecommunications Society are co-sponsoring
the first RATS Opens Systems Environment Symposium (ROSES-1).
ROSES-1 will be held on the 11th of November 1989 in the Student
Center of the New Jersey Institute of Technology from 8AM to
6PM. Talk-in will be on 145.19 (-600) and 147.225 (+600) MHz.
For further information contact Gordon Beattie, N2DSY at
201-387-8896 or via packet n2dsy@kd6th.

This event will include talks for the new and experienced operator.
All software discussed at the sessions will be available for free.
(plus cost of media - so bring 5-1/4 or 3-1/2 inch disks)

Also: Question and Answer Sessions,
Demonstrations,
TNC Tune-up (bring TNC and radio)
Equipment Literature,
Software Distribution,
License Examinations.

NOTE: ALL Sessions include a Question and Answer period.

Plan on dinner with your fellow operators!

For further information contact:

General: Gordon Beattie, N2DSY 201-387-8896 n2dsy@kd6th
Testing: Pete Adley, K2MHP 201-796-6622

The tentative schedule follows:

Activity 1 Activity 2

```
 ----------------------------------------------------------------

08:00    Coffee, Tea,              License Exams
         Doughnuts                    Start
                                        *
09:00    Introductions,                 *

Compiling is one thing, actually working is something else. I have svnos
xx.22u and smtp is broken amoung other things. I will take a look at
the newer programs and post my results.
 I also have a fixed version of svbm (bmq) and smtp for unix 3.2
If you want it call (416) 733-1630 for a TB2500 or 733-1609 for a
Microcom 9624. Its called newsmtp.cpio.Z and it can be found in
/usr/local/bbs/data/packet/newsmtp.cpio.Z. I have an open uucp account
called "bbsuucp" with no password to uucp it off.

Can anyone tell me if the little pocket TNC that Heath
sells (HK-21) supports KISS mode? One I looked at (about
one year out of date) didn't so I'm actually asking if
they have added KISS mode support.

Hello All,
After being moved (new nice house with hardly antenna space (what a fool i am)
I picked up Phils latest work. (891022) (wb3ffv and my nosv27 version)
I added the changes Phil made to domain area and my results are again on

flash.bellcore.com in /pub files domain.c and domain.h . These are direct
replacements for Phils version. They can also be found on wb3ffv bbs.
Extra features with my version are:
 Brians ampr.org file compatible ($origin support)
 Muliple line SOA record handling.
 All record types can be requested and answered!
 Domain server added. (for those not on the internet having a name server)
 Load of a subset of a domain.txt file into memory (instant cash response)
I do hope Phil wil finaly raise my version to "standard" (Yes, it is not
invented "here" syndrome is still active , i guess.)
Please send bug reports if appicable....
Regards, gerard.

I have a friend that owns a TRS80 model II (you know the one that runs CPM). He's also a packeteer and using for the moment a terminal emulator program (standart type), being interrested by a more friendly interface (that is split screen type) he asked me if there was something available in PD floating around, I'd be thankfull for any info concerning this program type, what where ... (NO FTP tho I'm on Bitnet ... SIMTEL's OK).

Now I got downloaded the last release of TCP-IP for the ATARI ST serie and blitzly installed home, got some problems with the file interface though, it seems that the sprintf(file_path,"%s/%s",sub_dir,file_name) was left unchanged, it should be more or less

```
sprintf(file_path,"%s%s",sub_dir,file_name)
                     ^^ due to TOS path names. this means SMTP does
```

not work at all, I've been able to get FTP,TELNET, I tried to zap the binaries and change the format to the right one but I just made it worse (BOMBS!) As I do not own one of the compiler used to generate the binaries, (I own Prospero 'C') and do not want to spent too much time on it I'd like to konw if some fix has been send or if the problem is known by the ST source manger(s) and when the corrected release will be made available (SIMTEL ?).

Thanks in advance,

Can anyone recommend a Packet BBS program running under CP/M for a two floppy Kaypro II? We just got this machine as a donation to

the campus amateur radio club and are trying to find something
useful to do with it. Many thanks. Please direct E-mail to the
following address:

Sandy, a lot of what you see is "regional" in nature. It's true that there are
plenty of Sysops who run a BBS (packet, RTTY, AMTOR MSOs) for pure ego
satisfaction. They're easy to identify...much like the old "Repeater God"
syndrome that appeared in the 60s. But let's not throw out the baby with the
bath water!

In this area (NY-NJ-CT-MA-PA etc) let's call it "northeast", we have indeed
gotten agreements between PBBS Sysops that the systems will be operated in such
fashion as to give all possible priority to the manual keyboard users on those
channels. We've been quite specific:

 1. No BBS-to-BBS linking on 2 meters if at all possible. We've established
complicated BBS-to-BBS trunking and backbone circuits to link the BBSs on
channels (220, 440) where "user" activity is not compromised. Whatever BBS
links appear on the 2-meter channels are used as "backup" only when the 220 and
440 intersystem links fail or become so excessively congested that there's no
choice but 2 meters.

 2. By mutual agreement, BBSs operating single-port systems will NOT forward or
accept inbound forwarding during "prime time", which in our area is defined as
1700 to 0100 local time. We insist that those hours be "reserved" for the
"users". If a BBS is running some form of "multi-tasking" software that permits
handling "users" on a 2-meter port while simultaneously linking intersystem

traffic on 220 and 440 trunk circuits, that's ok at any time as long as the "user" channels remain for the "exclusive" use of the "users".

We've been largely successful with this approach up here and we see no reason other than someone's sticky ego - for NOT doing the same thing or something similar in all areas where users share channels with linking BBSs. There's NO QUESTION that the "users" must get first consideration. The bottom line may not be obvious to some of these over-inflated Sysops: if they piss off the users and drive them all away, then there won't be any need for the BBSs!!! That's the real "bottom line".

Sandy, the "For Sale" issue on packet (and in ham radio in general) has been clearly resolved two ways; a letter of clarification was issued by the Commission; the New Part 97 that went into effect on September 1, 1989 also addresses the issue in non-ambiguous manner. The point is now moot....thank God.

Couple of additional thoughts 'ere I log off to read the stuff. It's unfair, after what we've done with the Hurricane Hugo and the San Francisco earthquake events, to state that nothing of value is passed via these packet BBSs. I can't state how many thousands of pieces of important traffic (important at least to the originators and the addressees) went through my six-port switch and HF net gateway related to these catastrophic events. There's no point in shooting the whole community in the ass because of a minority of ego-driven jackasses who can't see the truth because their own personalities get in the way.

Anyone who rightfully deserves the title of "Sysop" - System Operator- must be cognizant at all times of his or her ultimate responsibility to the USERS! Anything else is pure crap. Any concerned, sincere Sysop always considers the users....after all, the "users" are the "bread and butter" of any BBS....without 'em, you need a BBS like a hole in the head.

Nutha point...the implied responsibility assumed by the "user" when he or she climbs on the packet channels.....not enough users ever ask themselves the question, "do I need to do this by packet radio on a channel dedicated solely to packet radio?" What I mean is this:

There are literally dozens of cases in which two 'users' who wish to have a keyboard-to-keyboard chat are within VHF line of site... they have a good radio path between them. When that case exists and the goal is purely keyboard-to-keyboard QSO, then who the hell needs an error-correcting protocol like packet radio anyway? Just to show off the latest TNC and the power of the Plastic Money Card? More ego? Two guys with good radio paths at VHF or UHF can certainly move off to some quiet FM simplex channel and work each other using ASCII at 1200 bauds, or even Baudot at 300 bauds for hand-typing a QSO. You can even exchange ASCII text files using these non-packet modes...as long as the path is solid. It's kinda like the two dudes I used to know who lived six miles apart, clear path without any terrain obstacles...each one running a synthesized 2-meter rig and 150-watt amplifier into 7 and 11 element beams.....enough poop to pump a kilowatt ERP into each other's ears.....but would you believe that these two schmucks insisted on pointing their antennas at a local "wide-area" repeater instead of working simplex??? Why did they do this?? Simple...they were waving their egos in the air....they needed the

reassurance that everyone on the channel within 100 mile radius would be sure to hear their remarks.

Not enough people use the available VHF and UHF simplex channels with ASCII or Baudot at the highest speeds available in their multi-mode controllers. And from what I see in this area today, the guy on packet with the "packet-only" TNC is in the minority. The majority of the people around here have some kind of multi-mode unit -- so they can use Baudot and ASCII if they wish. I've done it myself many many times and frankly, for anything except a binary file transfer, or program source code in C or Pascal or assembler (where I DO need error detection and correction) the throughput achieved using ASCII at 1200 bauds BLOWS PACKET RADIO OUT OF THE WATER!

The rules remain unchanged in the new Part 97 as regards unattended HF operation. As NCS of the packet net operating on 14.111 under the Commission's STA for unattended operation (STA Letter 7230-J), I keep in close touch with both the League (which actually obtained the STA for us) and one or two key folks at the FCC. The rules still prohibit the unattended operation of ANY station on frequencies below 30 MHz without some form of exceptional authority like an STA.

I too see a significant number of digipeaters and BBSs that I KNOW to be unattended, especially on 20 meters. These guys place their licenses at risk. And from my recent chats (informal telephone contacts) with the Watch Officers at the Belfast, ME and Laurel, MD Monitoring Stations, I know that they are "looking". I've even discussed some of the "special features" contained in the packet TNCs they're using....from a manufacturer that coincidentally is a client for my consulting services. The FCC guys are not dummies. They go by priorities set by their managers. But they do watch, they do "listen". And so does the NSA, the DEA, the FBI, and a number of other un-namable agencies....looking at the possible use of the ham bands and digital modes by illegals perhaps involved with the drug traffic operations. Time will tell. I hope.

Part of the real problem with packet radio is that we amateurs are using a protocol based on X.25, which was specifically designed in the common carrier world for use on high-quality, equalized, noise-free full-duplex higher speed data lines in dedicated telephone networks. Now you bring that bastard AX.25 protocol into our simplex (half-duplex) noisy, poor frequency response, collision-filled radio world, and you have the packet radio we "know and love" today. Pity. Coulda been better choices but the fraternity went with what was available based on the IC devices available such as HDLC chips and the like. If you could watch a CCITT X.25 (or its big brother X.75) link zipping along on the telephone networks at 56 and 64 KBPS, and higher rates up to 1.54 MBPS, you'd understand that we're dealing with a "solution" that is less than optimal for our unique environment. It's part of the rationale that makes me personally prefer AMTOR/SITOR for traffic handling on HF. The latter protocols were specifically designed for our typically-rotten HF environment, while AX.25 was NOT.

Hierarchical routing is still a bit premature. According to various sources in the programming world, the present implementations by W0RLI, AA4RE and WA8BXN will possibly not match the final specs required for satellite operations and

when those final specs are released, it's estimated that the existing codes will require some significant rewriting. This appears to be the primary reason why Jeff Jacobsen, WA7MBL, has not yet released a version of his BBS code implementing hierarchical routing. As he stated it to me on the telephone six months ago, "I only wanna write this stuff ONCE!!!".

And additional analyses are showing that present implementations may be parsing backwards....left to right instead of RIGHT TO LEFT. Seems to make sense when looking for that "first match", that the first thing my system wants to know is "DOES IT STAY ON THIS CONTINENT? IF NO, THEN GET RID OF IT TO THE INTERCONTINENTAL GATEWAY AND IGNORE THE REST CUZ IT'S MOOT!". We've already found significant ambiguities in some hierarchical routes, to much to detail here. In addition, there's some question as to the suitability of using the ISO three-letter country codes instead of the well-established numeric country codes used in the CCITT International Numbering Scheme (in use in the telephone and telex/gentex networks for more than 25 years!!!). This may screw up future possibilities of interoperability (I love that word!!!) with telephone networks...something that people are already starting to give serious thought to. Any more thoughts?

I've been out of town for a while, and must have missed the original posting. I certainly never meant to imply that I was running the XOBBS code under Microport, since I'm not. What I probably meant to say was that, thanks to some essential patches supplied by John Limpert, N3DMC (johnl@n3dmc.UU.NET), I am running NET under Microport SysV/286 2.4. You will have a hard time running the base release without these patches, and I think that's what I pointed out in my original reply.

Does anyone have experience of the Digicom packet system for the C64?
How does it compare with a TNC? Are there any magazine articles,
books, papers etc that describe the system? Is there a Digicom kit?

Please reply to clinton.evans@canremote.uucp

My Brother (KA1PPG Needham Ma.) runs packet with a MFJ 1270B hooked upto
an IBM AT.

He just got a new chip for the MFJ that turns it into a mini BBS where
you can leave upto 99 messages (Thats with the IBM turned off!!!).

Here's the problem.....It only allows messages to be stored in 8K of the
RAM even thou it has 32K available and he doesn't want to leave the AT on
all the time.

Does anyone know how to let it use more than 8K of the RAM?

PS I looked in side many months ago and I think it was an Z80 CPU.

If thats true then does anyone have source code the the EPROMS
that I could modify (I have a Z80/8080 compiler and EPROM burner
at my home on an IBM)

email to grossman@bbn
or

I've been asked by someone for assistance in running KA9Q NET using a
KAM in KISS mode. Unfortunately, he is not local, so I can't go and
look at his setup; nor do I have a KAM to play with. Apparently he can
receive on both ports, but is having trouble with transmitting on the
HF port. I'd like to hear from anyone who is familiar with using the
KAM with NET.

I downloaded the version of NET that was posted by Rob PE1CHL at
flash.bellcore.com in /pub/chlnet. There is no BM.TOS program in the
archive for the ST NET, but there was a sample BM.RC file.

Is there a version of BM for the ST somewhere that works. Seem's to me
that the 8904 port doesn't have BM in it either and has some mention
about the version that was there was corrupted in someway.

I'm about to leave this job and go somewhere else that has no net acsess,
so prompt assistance would be appreciated. (I'm hoping to be able to
attach to the net, but not immediately)

Hi, Ray,

Do you really mean that ancient version in C, rather than the recent
ones in assembler in the Clarkson collection? That one is not a
separate installable TSR like the Clarkson ones.

If so, I found it. It is based on the 87xxxx.25 version of net.exe
and is in an .arc file consisting of the changed modules for that
version, including that wd8003e driver (ew.c and ew.h). The file
is net_ew.arc, in the (default) \public\ directory on bobcat.bbn.com
[128.89.2.103]. That machine is a slow 4.77 MHz true-blue IBM PC
(not even XT) that sits on the corner of my desk at work.

Rob has BM for the atari. I will ask Rob to send it to the USA for
distribution. There is only a paper version of the schematics of the
8530 interface. You can get an copy by sending a smail to Rob with a
few IRC's. The schematics of a IBM-PC 8530 interface are included
in my paper in the proceedings of the 8 ARRL data conference.

Yes,
I have a copy (October 89?) of BM.TOS which seems to work fine
on my ST and has quite a few additional features.

I got it off a diskette which came from Rob PE1CHL himself. I don't
remember if the archived version, 8908142st.arc, had it or not.

I suspect not if that is the same version you are talking about.
It should be available by anonymous ftp from
col.hp.com under ka9q/pe1chl/890814st.arc
and docs under   ka9q/pe1chl/net_doc.arc

Diana,
  I forgot to mention that I will put the new working version of
bm.tos on col.hp.com ASAP. Also I have schematics for Rob's
8530 and modem circuitry.

Anyone know the status of the TAPR 9600 baud radio/modem combo they were
to be releasing?? I am especially interested in the possibility of making
them work full duplex. I have a frequency pair assigned for a 1200 baud
FDuplex 440 repeater, but why bother?? I applied to be a beta tester for
the TAPR 9600 PacketRadio but I guess I'm just not cooool enough.
Also, does anyone know if the Tapr 9600's have to be tuned TO each other
(in pairs)?? Or, can remote nodes be built up with a scope and freq. counter?

I know this is Phil bait :-).. I'll have 1000's of memo's telling me
to get 56k modems.. The trick is to make the whole thing simple and
affordable to enough people. Really I just want a good backbone between
3 or 4 major cities, NO hidden terminals, and relatively few (if any) hops.
No doubt the traffic at the far ends will be 1200 baud till I'm old enough to
retire..
The 440 stick, fed with 7/8" Heliax is ALREADY up and WAITING (120' above the
Baraboo, Wi. bluffs).

Well?

Has anyone collected a summary of:

1. Modem cards, having ready connection between CPU and radio for ham radio uses,

2. High speed serial port cards,

3. External modems for #2 and ham radio (not TNC's unless direct modem capability is included),

for IBM PC and clones using 8 bit or preferabbly 16 bit bus? Comments and suggestions are also welcome. Anticipated machine will being either an Amiga 2000 with IBM Bridgecard (AT bus) or a CompuAdd 316s (386SX).

I want a PK-232 tnc... Thought about buying one from AEA, but noticed that Heath has a kit version that sells for $289.90 including technical manual. Is this a good deal? Can I buy an AEA assembled tnc for less? if so, where? All info appreciated...

Incidentally, if anyone in the San Francisco bay area wants to sell his or hers PK-232, I'd be interested.

>Anyone know the status of the TAPR 9600 baud radio/modem combo they were
>to be releasing??

It's still being worked on, but it's taking longer than expected to get out into Beta test. You should be aware, by the way, that only a 2m radio is under development. In my opinion that effectively rules out full duplex, since crossband operation is by far the easiest way to get full duplex.

>I know this is Phil bait :-).. I'll have 1000's of memo's telling me
>to get 56k modems.. The trick is to make the whole thing simple and
>affordable to enough people.

Well you got me. Here's memo 1001. :-) Because I'm a Director of TAPR I have been previously reluctant to comment publicly on the TAPR 9600 baud radio, but I do have to say that I don't understand why so many people who express so much interest in it can't get interested in the WA4DSY 56k unit. In my opinion the latter is much more suitable for serious high speed packet operation, for the following reasons:

1. The design is highly modular. You can build independent transmit and receive sections, and they can be on any band you choose.

2. The transmitter generates MSK instead of noncoherent FSK. This results in a very clean, efficient and stable spectrum, and the "deviation" adjustment is inherently exactly correct. The adjustments that you do have to make are very easy to do with a scope; you don't need a calibrated deviation meter.

3. Even though the current WA4DSY demod design uses a noncoherent discriminator (i.e., it treats the incoming MSK signal as though it were noncoherent FSK) the transmitter's use of MSK holds open the option of later building true coherent demodulators. These would give a 5-6 dB improvement in link performance with NO changes required at the transmitter. This option is precluded by modulators like the TAPR modem that just FM a crystal noncoherently.

4. The WA4DSY modem runs 5.8 times as fast as the 9600 modem, but for a lot

less than 5.8 times the cost! I don't know how the 9600 modem is going to price out, but I would be very surprised if it ends up being less than 75% of the cost of a complete WA4DSY modem.

5. And, last but not least, the WA4DSY modem design has been proven in actual use for several years, and it is available NOW! It's not at all difficult to assemble and check out; see my review in the October issue of 73.

I certainly don't oppose the TAPR 9600 baud packet radio modem project; God knows that even it would be a vast improvement over 1200 baud Bell 202 tones on 2m, and it would be a waste to slow down a perfectly good WA4DSY modem to fit it into the 2m 20 KHz bandwidth limit. But if you're going to operate on bands above 2m (which, in my opinion, is unsuitable for serious packet radio operation anyway) then the WA4DSY modem is the clear choice.

Phil

Heath's HK-232 TNC looks conspicuously similar to AEA's PK-232. Why the names have only one difference between them. Are they the same? I suspect they are.

If they are, that means I can use Heath's PC software for the HK-232 with my PK-232. Does anyone know if this will work?

(No chance for a direct reply, my mail bounced. So here goes ...)

If you compare DIGICOM to a TNC you should take a close look to the
release number. Some DC releases are named 4.** but these are patched
versions, because the 'official' newest release is 3.5 and available
since about two weeks. I met Flori, DL8MBT (the originator of DIGICOM)
last saturday and he told me that even the DAMA features are included
in this current release (see the newest proceedings). Plus further
enhancements. An english version of the new user manual is under
translation right now and will be available soon.

Detlef (DK4EG @ DK0MAV)

Subject: NTS H&W traffic

I had planned on posting this sooner, but y'all know how it is.

How to Prepare and Send Welfare Traffic

As recent events in the San Francisco Bay area have shown, all hams should know
how to handle dister traffic. These are simple skills to learn. Those of you
involved in novice classes should take the time to pass on these tips as a part
of your class.

Disaster (or Health and Welfare) traffic should always be sent in the NTS format. This way your message will have an unique ID (your call and message number) in case the delivering opeator needs to contact you with a return message or a request for further information. Remember, during a disaster the tracing of people and deliving of messages will be complicated by the disaster itself.

Keep the message brief. Use the ARL ninteen radiogram whenver possible. Over 6000 pieces of traffic were routed into and out of the Bay area in the week following the earthquake.

If the message includes a "call back", include the name, address, and telephone number, if possible. This information can be used to direct a message directly to the originator.

Sending Welfare Traffic via Packet

As our experience here in northern California has shown, packet can handle large volumes of traffic easily. Each of the BBS sysops can tell you some wonderful stories about their own situation, but the traffic was quickly routed.

Use the following as a guide to sending welfare traffic on packet:

As with any NTS traffic, use the ST command to enter your message into the BBS.

Use the ZIP @ NTSXX format whenever possible. If you don't know the zipcode, look it up, or call your local post office. Using the zipcode is more important when sending welfare traffic, as some where along the line (most likely in the disaster area) someone will have to plug the zipcode into the proper field. This will delay your message and create extra work for a beleagured sysop in the disaster area.

An example of a correct entry is:

ST 97140 @ NTSOR

If it is impossible to get the zipcode, route the message to NTSXX @ NTSXX, where XX is the 2-letter postal code. For example, to send a message to Colorado, you would use

ST NTSCO @ NTSCO

When the BBS asks for the Subject of your message, the normal form is: QTC <city phone>. Include enough of the phone number so the delivering station can ascertain whether it is a call that can be easily made from his or her location. Often the prefix is sufficient.

Do not book welfare traffic. Once into the disaster area, an overworked sysop will have to break down the book and route the individual pieces of traffic. This will delay your traffic.

Rule of Thumb

Hams are extremely busy in the disaster area. Many of our qualified NTS operators are also involved in ARES and RACES programs, so welfare traffic may not be high on their priority list. Unskilled operators will step in and help as much as they can.

Make it easy on the delivering station (and those stations handling your traffic along the way). Do your homework. Include as much information as possible about the addressee and the signator. Your chances of getting your welfare message delivered (and a possible answer) will increase dramatically.

Subject: TAPR 9600 RAdio/Modems???

>Anyone know the status of the TAPR 9600 baud radio/modem combo they were
>to be releasing??

It's still being worked on, but it's taking longer than expected to get out into Beta test. You should be aware, by the way, that only a 2m radio is under development. In my opinion that effectively rules out full duplex, since crossband operation is by far the easiest way to get full duplex.

>I know this is Phil bait :-).. I'll have 1000's of memo's telling me
>to get 56k modems.. The trick is to make the whole thing simple and
>affordable to enough people.

Well you got me. Here's memo 1001. :-) Because I'm a Director of TAPR I have been previously reluctant to comment publicly on the TAPR 9600 baud radio, but I do have to say that I don't understand why so many people who express so much interest in it can't get interested in the WA4DSY 56k unit. In my opinion the latter is much more suitable for serious high speed packet operation, for the following reasons:

1. The design is highly modular. You can build independent transmit and receive sections, and they can be on any band you choose.

2. The transmitter generates MSK instead of noncoherent FSK. This results in a very clean, efficient and stable spectrum, and the "deviation" adjustment is inherently exactly correct. The adjustments that you do have to make are very easy to do with a scope; you don't need a calibrated deviation meter.

3. Even though the current WA4DSY demod design uses a noncoherent discriminator (i.e., it treats the incoming MSK signal as though it were noncoherent FSK) the transmitter's use of MSK holds open the option of later building true coherent demodulators. These would give a 5-6 dB improvement in link performance with NO changes required at the transmitter. This option is precluded by modulators like the TAPR modem that just FM a crystal noncoherently.

4. The WA4DSY modem runs 5.8 times as fast as the 9600 modem, but for a lot less than 5.8 times the cost! I don't know how the 9600 modem is going to price out, but I would be very surprised if it ends up being less than 75% of the cost of a complete WA4DSY modem.

5. And, last but not least, the WA4DSY modem design has been proven in actual use for several years, and it is available NOW! It's not at all difficult to assemble and check out; see my review in the October issue of 73.

I certainly don't oppose the TAPR 9600 baud packet radio modem project; God knows that even it would be a vast improvement over 1200 baud Bell 202 tones on 2m, and it would be a waste to slow down a perfectly good WA4DSY modem to fit it into the 2m 20 KHz bandwidth limit. But if you're going to operate on bands above 2m (which, in my opinion, is unsuitable for serious packet radio operation anyway) then the WA4DSY modem is the clear choice.

Phil

Subject: Atari ST BM program

Yes,
I have a copy (October 89?) of BM.TOS which seems to work fine
on my ST and has quite a few additional features.

I got it off a diskette which came from Rob PE1CHL himself. I don't
remember if the archived version, 8908142st.arc, had it or not.
I suspect not if that is the same version you are talking about.
It should be available by anonymous ftp from
col.hp.com under ka9q/pe1chl/890814st.arc
and docs under   ka9q/pe1chl/net_doc.arc

Subject: Radio built into PeeCee?

Okay, gang, here's what I think would be a Neat Project.

Rather than have a PC emulating a terminal talking to a TNC talking to a radio, we can of course have the PC act as the TNC and talk straight to the radio. HAPN does that now, which is Good. Now the tough part.

Let's buld a (packet) radio into the PeeCee. Your basic Clone has a pretty good power supply (8 A at +12V, 20A at +5 V for your AT-class 200w). Much of the logic on a synthesizer is decoding the control, which sounds like a natural PC application. Build it all on one and you can simplify the interface to the modulator, etc.

The "full sized" PC card is pretty big, and there are drive bays if you need more space. The tough part, of course, is shielding: You have to protect the front end from all that noise inside the FCC-compliant PC case. Hey, what's a little challenge?

Any ideas?

(No chance for a direct reply, my mail bounced. So here goes ...)

If you compare DIGICOM to a TNC you should take a close look to the
release number. Some DC releases are named 4.** but these are patched
versions, because the 'official' newest release is 3.5 and available
since about two weeks. I met Flori, DL8MBT (the originator of DIGICOM)
last saturday and he told me that even the DAMA features are included
in this current release (see the newest proceedings). Plus further
enhancements. An english version of the new user manual is under
translation right now and will be available soon.

Subject: KA9Q and the KAM

I've been asked by someone for assistance in running KA9Q NET using a
KAM in KISS mode. Unfortunately, he is not local, so I can't go and
look at his setup; nor do I have a KAM to play with. Apparently he can
receive on both ports, but is having trouble with transmitting on the
HF port. I'd like to hear from anyone who is familiar with using the
KAM with NET.

Subject: NTS H&W traffic

I had planned on posting this sooner, but y'all know how it is.

How to Prepare and Send Welfare Traffic

As recent events in the San Francisco Bay area have shown, all hams should know how to handle dister traffic. These are simple skills to learn. Those of you involved in novice classes should take the time to pass on these tips as a part of your class.

Disaster (or Health and Welfare) traffic should always be sent in the NTS format. This way your message will have an unique ID (your call and message number) in case the delivering opeator needs to contact you with a return message or a request for further information. Remember, during a disaster the tracing of people and deliving of messages will be complicated by the disaster itself.

Keep the message brief. Use the ARL ninteen radiogram whenver possible. Over 6000 pieces of traffic were routed into and out of the Bay area in the week following the earthquake.

If the message includes a "call back", include the name, address, and telephone number, if possible. This information can be used to direct a message directly to the originator.

Sending Welfare Traffic via Packet

As our experience here in northern California has shown, packet can handle large volumes of traffic easily. Each of the BBS sysops can tell you some wonderful stories about their own situation, but the traffic was quickly routed.

Use the following as a guide to sending welfare traffic on packet:

As with any NTS traffic, use the ST command to enter your message into the BBS.

Use the ZIP @ NTSXX format whenever possible. If you don't know the zipcode, look it up, or call your local post office. Using the zipcode is more important when sending welfare traffic, as some where along the line (most likely in the disaster area) someone will have to plug the zipcode into the proper field. This will delay your message and create extra work for a beleagured sysop in the disaster area.

An example of a correct entry is:

ST 97140 @ NTSOR

If it is impossible to get the zipcode, route the message to NTSXX @ NTSXX, where XX is the 2-letter postal code. For example, to send a message to Colorado, you would use

ST NTSCO @ NTSCO

When the BBS asks for the Subject of your message, the normal form is:
QTC <city phone>. Include enough of the phone number so the delivering station can ascertain whether it is a call that can be easily made from his or her location. Often the prefix is sufficient.

Do not book welfare traffic. Once into the disaster area, an overworked sysop will have to break down the book and route the individual pieces of traffic. This will delay your traffic.

Rule of Thumb

Hams are extremely busy in the disaster area. Many of our qualified NTS operators are also involved in ARES and RACES programs, so welfare traffic may not be high on their priority list. Unskilled operators will step in and help as much as they can.

Make it easy on the delivering station (and those stations handling your traffic along the way). Do your homework. Include as much information as possible about the addressee and the signator. Your chances of getting your welfare message delivered (and a possible answer) will increase dramatically.

Subject: PK-232 prices - info request

I want a PK-232 tnc... Thought about buying one from AEA, but noticed that Heath has a kit version that sells for $289.90 including technical manual. Is this a good deal? Can I buy an AEA assembled tnc for less? if so, where? All info appreciated...

Incidentally, if anyone in the San Francisco bay area wants to sell his or hers PK-232, I'd be interested.

Subject: TAPR 9600 RAdio/Modems???

Comment: Processed by UWGATE

to: rec-ham-radio-packet@ucsd.edu

Anyone know the status of the TAPR 9600 baud radio/modem combo they were
to be releasing?? I am especially interested in the possibility of making
them work full duplex. I have a frequency pair assigned for a 1200 baud
FDuplex 440 repeater, but why bother?? I applied to be a beta tester for
the TAPR 9600 PacketRadio but I guess I'm just not cooool enough.
Also, does anyone know if the Tapr 9600's have to be tuned TO each other
(in pairs)?? Or, can remote nodes be built up with a scope and freq. counter?

I know this is Phil bait :-).. I'll have 1000's of memo's telling me
to get 56k modems.. The trick is to make the whole thing simple and
affordable to enough people. Really I just want a good backbone between
3 or 4 major cities, NO hidden terminals, and relatively few (if any) hops.
No doubt the traffic at the far ends will be 1200 baud till I'm old enough to
retire..
The 440 stick, fed with 7/8" Heliax is ALREADY up and WAITING (120' above the
Baraboo, Wi. bluffs).

Well?

Well you got me. Here's memo 1001. :-) Because I'm a Director of TAPR I have
been previously reluctant to comment publicly on the TAPR 9600 baud radio,
but I do have to say that I don't understand why so many people who express
so much interest in it can't get interested in the WA4DSY 56k unit. In my
opinion the latter is much more suitable for serious high speed packet
operation, for the following reasons:

1. The design is highly modular. You can build independent transmit and
receive sections, and they can be on any band you choose.

2. The transmitter generates MSK instead of noncoherent FSK. This results in a very clean, efficient and stable spectrum, and the "deviation" adjustment is inherently exactly correct. The adjustments that you do have to make are very easy to do with a scope; you don't need a calibrated deviation meter.

3. Even though the current WA4DSY demod design uses a noncoherent discriminator (i.e., it treats the incoming MSK signal as though it were noncoherent FSK) the transmitter's use of MSK holds open the option of later building true coherent demodulators. These would give a 5-6 dB improvement in link performance with NO changes required at the transmitter. This option is precluded by modulators like the TAPR modem that just FM a crystal noncoherently.

4. The WA4DSY modem runs 5.8 times as fast as the 9600 modem, but for a lot less than 5.8 times the cost! I don't know how the 9600 modem is going to price out, but I would be very surprised if it ends up being less than 75% of the cost of a complete WA4DSY modem.

5. And, last but not least, the WA4DSY modem design has been proven in actual use for several years, and it is available NOW! It's not at all difficult to assemble and check out; see my review in the October issue of 73.

I certainly don't oppose the TAPR 9600 baud packet radio modem project; God knows that even it would be a vast improvement over 1200 baud Bell 202 tones on 2m, and it would be a waste to slow down a perfectly good WA4DSY modem to fit it into the 2m 20 KHz bandwidth limit. But if you're going to operate on bands above 2m (which, in my opinion, is unsuitable for serious packet radio operation anyway) then the WA4DSY modem is the clear choice.

Phil

Subject: Atari ST BM program

Yes,
I have a copy (October 89?) of BM.TOS which seems to work fine
on my ST and has quite a few additional features.

I got it off a diskette which came from Rob PE1CHL himself. I don't
remember if the archived version, 8908142st.arc, had it or not.
I suspect not if that is the same version you are talking about.
It should be available by anonymous ftp from
col.hp.com under ka9q/pe1chl/890814st.arc
and docs under ka9q/pe1chl/net_doc.arc

Diana,
  I forgot to mention that I will put the new working version of
bm.tos on col.hp.com ASAP. Also I have schematics for Rob's
8530 and modem circuitry.

>Does anyone have experience of the Digicom packet system for the C64?
>How does it compare with a TNC? Are there any magazine articles,
>...

(No chance for a direct reply, my mail bounced. So here goes ...)

If you compare DIGICOM to a TNC you should take a close look to the
release number. Some DC releases are named 4.** but these are patched
versions, because the 'official' newest release is 3.5 and available
since about two weeks. I met Flori, DL8MBT (the originator of DIGICOM)
last saturday and he told me that even the DAMA features are included
in this current release (see the newest proceedings). Plus further
enhancements. An english version of the new user manual is under
translation right now and will be available soon.

From: mitel!sce!cognos!dgbt!barry@uunet.uu.net (Barry Mclarnon DGBT/DIP)
Subject: KA9Q and the KAM

I've been asked by someone for assistance in running KA9Q NET using a
KAM in KISS mode. Unfortunately, he is not local, so I can't go and
look at his setup; nor do I have a KAM to play with. Apparently he can
receive on both ports, but is having trouble with transmitting on the
HF port. I'd like to hear from anyone who is familiar with using the
KAM with NET.

Subject: NTS H&W traffic

I had planned on posting this sooner, but y'all know how it is.

How to Prepare and Send Welfare Traffic

As recent events in the San Francisco Bay area have shown, all hams should know how to handle dister traffic. These are simple skills to learn. Those of you involved in novice classes should take the time to pass on these tips as a part of your class.

Disaster (or Health and Welfare) traffic should always be sent in the NTS format. This way your message will have an unique ID (your call and message number) in case the delivering opeator needs to contact you with a return message or a request for further information. Remember, during a disaster the tracing of people and deliving of messages will be complicated by the disaster itself.

Keep the message brief. Use the ARL ninteen radiogram whenver possible. Over 6000 pieces of traffic were routed into and out of the Bay area in the week following the earthquake.

If the message includes a "call back", include the name, address, and telephone number, if possible. This information can be used to direct a message directly to the originator.

Sending Welfare Traffic via Packet

As our experience here in northern California has shown, packet can handle large volumes of traffic easily. Each of the BBS sysops can tell you some wonderful stories about their own situation, but the traffic was quickly routed.

Use the following as a guide to sending welfare traffic on packet:

As with any NTS traffic, use the ST command to enter your message into the BBS.

Use the ZIP @ NTSXX format whenever possible. If you don't know the zipcode, look it up, or call your local post office. Using the zipcode is more important when sending welfare traffic, as some where along the line (most likely in the disaster area) someone will have to plug the zipcode into the proper field. This will delay your message and create extra work for a beleagured sysop in the disaster area.

An example of a correct entry is:

ST 97140 @ NTSOR

If it is impossible to get the zipcode, route the message to NTSXX @ NTSXX, where XX is the 2-letter postal code. For example, to send a message to Colorado, you would use

ST NTSCO @ NTSCO

When the BBS asks for the Subject of your message, the normal form is: QTC <city phone>. Include enough of the phone number so the delivering station can ascertain whether it is a call that can be easily made from his or her location. Often the prefix is sufficient.

Do not book welfare traffic. Once into the disaster area, an overworked sysop will have to break down the book and route the individual pieces of traffic. This will delay your traffic.

Rule of Thumb

Hams are extremely busy in the disaster area. Many of our qualified NTS operators are also involved in ARES and RACES programs, so welfare traffic may not be high on their priority list. Unskilled operators will step in and help as much as they can.

Make it easy on the delivering station (and those stations handling your traffic along the way). Do your homework. Include as much information as possible about the addressee and the signator. Your chances of getting your welfare message delivered (and a possible answer) will increase dramatically.

Subject: PK-232 prices - info request

I want a PK-232 tnc... Thought about buying one from AEA, but noticed that Heath has a kit version that sells for $289.90 including technical manual. Is this a good deal? Can I buy an AEA assembled tnc for less? if so, where? All info appreciated...

Incidentally, if anyone in the San Francisco bay area wants to sell his or hers PK-232, I'd be interested.

Subject: TAPR 9600 RAdio/Modems???

Comment: Processed by UWGATE

to: rec-ham-radio-packet@ucsd.edu

Anyone know the status of the TAPR 9600 baud radio/modem combo they were to be releasing?? I am especially interested in the possibility of making them work full duplex. I have a frequency pair assigned for a 1200 baud FDuplex 440 repeater, but why bother?? I applied to be a beta tester for the TAPR 9600 PacketRadio but I guess I'm just not cooool enough.
Also, does anyone know if the Tapr 9600's have to be tuned TO each other (in pairs)?? Or, can remote nodes be built up with a scope and freq. counter?

I know this is Phil bait :-).. I'll have 1000's of memo's telling me to get 56k modems.. The trick is to make the whole thing simple and affordable to enough people. Really I just want a good backbone between 3 or 4 major cities, NO hidden terminals, and relatively few (if any) hops. No doubt the traffic at the far ends will be 1200 baud till I'm old enough to retire..
The 440 stick, fed with 7/8" Heliax is ALREADY up and WAITING (120' above the Baraboo, Wi. bluffs).

Well?

Subject: TAPR 9600 RAdio/Modems???

>Anyone know the status of the TAPR 9600 baud radio/modem combo they were
>to be releasing??

It's still being worked on, but it's taking longer than expected to get out into Beta test. You should be aware, by the way, that only a 2m radio is under development. In my opinion that effectively rules out full duplex, since crossband operation is by far the easiest way to get full duplex.

>I know this is Phil bait :-).. I'll have 1000's of memo's telling me
>to get 56k modems.. The trick is to make the whole thing simple and
>affordable to enough people.

Well you got me. Here's memo 1001. :-) Because I'm a Director of TAPR I have been previously reluctant to comment publicly on the TAPR 9600 baud radio, but I do have to say that I don't understand why so many people who express so much interest in it can't get interested in the WA4DSY 56k unit. In my opinion the latter is much more suitable for serious high speed packet

operation, for the following reasons:

1. The design is highly modular. You can build independent transmit and receive sections, and they can be on any band you choose.

2. The transmitter generates MSK instead of noncoherent FSK. This results in a very clean, efficient and stable spectrum, and the "deviation" adjustment is inherently exactly correct. The adjustments that you do have to make are very easy to do with a scope; you don't need a calibrated deviation meter.

3. Even though the current WA4DSY demod design uses a noncoherent discriminator (i.e., it treats the incoming MSK signal as though it were noncoherent FSK) the transmitter's use of MSK holds open the option of later building true coherent demodulators. These would give a 5-6 dB improvement in link performance with NO changes required at the transmitter. This option is precluded by modulators like the TAPR modem that just FM a crystal noncoherently.

4. The WA4DSY modem runs 5.8 times as fast as the 9600 modem, but for a lot less than 5.8 times the cost! I don't know how the 9600 modem is going to price out, but I would be very surprised if it ends up being less than 75% of the cost of a complete WA4DSY modem.

5. And, last but not least, the WA4DSY modem design has been proven in actual use for several years, and it is available NOW! It's not at all difficult to assemble and check out; see my review in the October issue of 73.

I certainly don't oppose the TAPR 9600 baud packet radio modem project; God knows that even it would be a vast improvement over 1200 baud Bell 202 tones on 2m, and it would be a waste to slow down a perfectly good WA4DSY modem to fit it into the 2m 20 KHz bandwidth limit. But if you're going to operate on bands above 2m (which, in my opinion, is unsuitable for serious packet radio operation anyway) then the WA4DSY modem is the clear choice.

Phil

Subject: Atari ST BM program

Yes,
I have a copy (October 89?) of BM.TOS which seems to work fine
on my ST and has quite a few additional features.

I got it off a diskette which came from Rob PE1CHL himself. I don't
remember if the archived version, 8908142st.arc, had it or not.
I suspect not if that is the same version you are talking about.
It should be available by anonymous ftp from
col.hp.com under ka9q/pe1chl/890814st.arc
and docs under   ka9q/pe1chl/net_doc.arc

Subject: Radio built into PeeCee?

Okay, gang, here's what I think would be a Neat Project.

Rather than have a PC emulating a terminal talking to a TNC talking to a
radio, we can of course have the PC act as the TNC and talk straight
to the radio. HAPN does that now, which is Good. Now the tough part.

Let's buld a (packet) radio into the PeeCee. Your basic Clone has a
pretty good power supply (8 A at +12V, 20A at +5 V for your AT-class
200w). Much of the logic on a synthesizer is decoding the control,
which sounds like a natural PC application. Build it all on one and you
can simplify the interface to the modulator, etc.

The "full sized" PC card is pretty big, and there are drive bays if you need more space. The tough part, of course, is shielding: You have to protect the front end from all that noise inside the FCC-compliant PC case. Hey, what's a little challenge?

Any ideas?

>...

(No chance for a direct reply, my mail bounced. So here goes ...)

If you compare DIGICOM to a TNC you should take a close look to the
release number. Some DC releases are named 4.** but these are patched
versions, because the 'official' newest release is 3.5 and available
since about two weeks. I met Flori, DL8MBT (the originator of DIGICOM)
last saturday and he told me that even the DAMA features are included
in this current release (see the newest proceedings). Plus further
enhancements. An english version of the new user manual is under
translation right now and will be available soon.

From: mitel!sce!cognos!dgbt!barry@uunet.uu.net (Barry Mclarnon DGBT/DIP)
Subject: KA9Q and the KAM

I've been asked by someone for assistance in running KA9Q NET using a
KAM in KISS mode. Unfortunately, he is not local, so I can't go and
look at his setup; nor do I have a KAM to play with. Apparently he can
receive on both ports, but is having trouble with transmitting on the
HF port. I'd like to hear from anyone who is familiar with using the
KAM with NET.

Subject: NTS H&W traffic

I had planned on posting this sooner, but y'all know how it is.

How to Prepare and Send Welfare Traffic

As recent events in the San Francisco Bay area have shown, all hams should know
how to handle dister traffic. These are simple skills to learn. Those of you
involved in novice classes should take the time to pass on these tips as a part
of your class.

Disaster (or Health and Welfare) traffic should always be sent in the NTS format. This way your message will have an unique ID (your call and message number) in case the delivering opeator needs to contact you with a return message or a request for further information. Remember, during a disaster the tracing of people and deliving of messages will be complicated by the disaster itself.

Keep the message brief. Use the ARL ninteen radiogram whenver possible. Over 6000 pieces of traffic were routed into and out of the Bay area in the week following the earthquake.

If the message includes a "call back", include the name, address, and telephone number, if possible. This information can be used to direct a message directly to the originator.

Sending Welfare Traffic via Packet

As our experience here in northern California has shown, packet can handle large volumes of traffic easily. Each of the BBS sysops can tell you some wonderful stories about their own situation, but the traffic was quickly routed.

Use the following as a guide to sending welfare traffic on packet:

As with any NTS traffic, use the ST command to enter your message into the BBS.

Use the ZIP @ NTSXX format whenever possible. If you don't know the zipcode, look it up, or call your local post office. Using the zipcode is more important when sending welfare traffic, as some where along the line (most likely in the disaster area) someone will have to plug the zipcode into the proper field. This will delay your message and create extra work for a beleagured sysop in the disaster area.

An example of a correct entry is:

ST 97140 @ NTSOR

If it is impossible to get the zipcode, route the message to NTSXX @ NTSXX, where XX is the 2-letter postal code. For example, to send a message to Colorado, you would use

ST NTSCO @ NTSCO

When the BBS asks for the Subject of your message, the normal form is: QTC <city phone>. Include enough of the phone number so the delivering station can ascertain whether it is a call that can be easily made from his or her location. Often the prefix is sufficient.

Do not book welfare traffic. Once into the disaster area, an overworked sysop will have to break down the book and route the individual pieces of traffic. This will delay your traffic.

Rule of Thumb

Hams are extremely busy in the disaster area. Many of our qualified NTS operators are also involved in ARES and RACES programs, so welfare traffic may not be high on their priority list. Unskilled operators will step in and help as much as they can.

Make it easy on the delivering station (and those stations handling your traffic along the way). Do your homework. Include as much information as possible about the addressee and the signator. Your chances of getting your welfare message delivered (and a possible answer) will increase dramatically.

Subject: PK-232 prices - info request

I want a PK-232 tnc... Thought about buying one from AEA, but noticed that Heath has a kit version that sells for $289.90 including technical manual. Is this a good deal? Can I buy an AEA assembled tnc for less? if so, where? All info appreciated...

Incidentally, if anyone in the San Francisco bay area wants to sell his or hers PK-232, I'd be interested.

Subject: TAPR 9600 RAdio/Modems???

Comment: Processed by UWGATE

to: rec-ham-radio-packet@ucsd.edu

Anyone know the status of the TAPR 9600 baud radio/modem combo they were to be releasing?? I am especially interested in the possibility of making them work full duplex. I have a frequency pair assigned for a 1200 baud FDuplex 440 repeater, but why bother?? I applied to be a beta tester for the TAPR 9600 PacketRadio but I guess I'm just not cooool enough.
Also, does anyone know if the Tapr 9600's have to be tuned TO each other (in pairs)?? Or, can remote nodes be built up with a scope and freq. counter?

I know this is Phil bait :-).. I'll have 1000's of memo's telling me to get 56k modems.. The trick is to make the whole thing simple and

affordable to enough people. Really I just want a good backbone between
3 or 4 major cities, NO hidden terminals, and relatively few (if any) hops.
No doubt the traffic at the far ends will be 1200 baud till I'm old enough to
retire..
The 440 stick, fed with 7/8" Heliax is ALREADY up and WAITING (120' above the
Baraboo, Wi. bluffs).

Well?

Subject: TAPR 9600 RAdio/Modems???

>Anyone know the status of the TAPR 9600 baud radio/modem combo they were
>to be releasing??

It's still being worked on, but it's taking longer than expected to get out
into Beta test. You should be aware, by the way, that only a 2m radio is
under development. In my opinion that effectively rules out full duplex,
since crossband operation is by far the easiest way to get full duplex.

>I know this is Phil bait :-).. I'll have 1000's of memo's telling me
>to get 56k modems.. The trick is to make the whole thing simple and
>affordable to enough people.

Well you got me. Here's memo 1001. :-) Because I'm a Director of TAPR I have
been previously reluctant to comment publicly on the TAPR 9600 baud radio,
but I do have to say that I don't understand why so many people who express
so much interest in it can't get interested in the WA4DSY 56k unit. In my
opinion the latter is much more suitable for serious high speed packet
operation, for the following reasons:

1. The design is highly modular. You can build independent transmit and
receive sections, and they can be on any band you choose.

2. The transmitter generates MSK instead of noncoherent FSK. This results in
a very clean, efficient and stable spectrum, and the "deviation" adjustment
is inherently exactly correct. The adjustments that you do have to make are
very easy to do with a scope; you don't need a calibrated deviation meter.

3. Even though the current WA4DSY demod design uses a noncoherent
discriminator (i.e., it treats the incoming MSK signal as though it were
noncoherent FSK) the transmitter's use of MSK holds open the option of later
building true coherent demodulators. These would give a 5-6 dB improvement
in link performance with NO changes required at the transmitter. This option
is precluded by modulators like the TAPR modem that just FM a crystal

noncoherently.

4. The WA4DSY modem runs 5.8 times as fast as the 9600 modem, but for a lot less than 5.8 times the cost! I don't know how the 9600 modem is going to price out, but I would be very surprised if it ends up being less than 75% of the cost of a complete WA4DSY modem.

5. And, last but not least, the WA4DSY modem design has been proven in actual use for several years, and it is available NOW! It's not at all difficult to assemble and check out; see my review in the October issue of 73.

I certainly don't oppose the TAPR 9600 baud packet radio modem project; God knows that even it would be a vast improvement over 1200 baud Bell 202 tones on 2m, and it would be a waste to slow down a perfectly good WA4DSY modem to fit it into the 2m 20 KHz bandwidth limit. But if you're going to operate on bands above 2m (which, in my opinion, is unsuitable for serious packet radio operation anyway) then the WA4DSY modem is the clear choice.

Phil

>are.

Yes, they are the same. The Heathkit is the kit version of the AEA PK-232.
It comes with a re-written manual, allegedly written with the newcomer in
mind.

I posted a inquiry a couple of days back asking if anybody knew of places
where you can buy an AEA PK-232 as cheap or cheaper than the Heathkit. Any
info? If I can't find an assembled unit for the same or lower price than
Heathkit's, then I'll build one.

>>Anyone know the status of the TAPR 9600 baud radio/modem combo they were
>>to be releasing??

>ka9q.bellcore.com!karn@bellcore.com (Phil Karn) replies:
>It's still being worked on, but it's taking longer than expected to get out
>into Beta test. You should be aware, by the way, that only a 2m radio is
>under development. In my opinion that effectively rules out full duplex,
>since crossband operation is by far the easiest way to get full duplex.

>>I know this is Phil bait :-).. I'll have 1000's of memo's telling me
>>to get 56k modems.. The trick is to make the whole thing simple and
>>affordable to enough people.

>Well you got me. Here's memo 1001. :-) Because I'm a Director of TAPR I have
>been previously reluctant to comment publicly on the TAPR 9600 baud radio,
>but I do have to say that I don't understand why so many people who express
>so much interest in it can't get interested in the WA4DSY 56k unit. In my
>opinion the latter is much more suitable for serious high speed packet
>operation, for the following reasons:

[Lots of good stuff on the DSY modem deleted]

>I certainly don't oppose the TAPR 9600 baud packet radio modem project; God
>knows that even it would be a vast improvement over 1200 baud Bell 202 tones
>on 2m, and it would be a waste to slow down a perfectly good WA4DSY modem to
>fit it into the 2m 20 KHz bandwidth limit. But if you're going to operate on
>bands above 2m (which, in my opinion, is unsuitable for serious packet radio
>operation anyway) then the WA4DSY modem is the clear choice.

Phil you are right, your opinions are highly valued... but let me try to put

what I consider to be some reality into this situation.

Most of packet radio in this country is at 1200 baud and on two meters. Yes I know that there are exceptions and very big ones at that, but I am not talking about California or Texas or other bits and pieces of the U.S.A., I am talking about the whole country in general.

To put any kind of ham radio packet network together takes some specific ingredients to get off the ground.

1. Knowledge
2. Money
3. Time

The knowledge has to be diversified in content and geographically spread to the point that each area can individually contribute towards the effort.

The same people that have the knowledge need to have the money or be able to raise it to do the things they want.

They need to make the time to collect the money, build the equipment, make it work, and then install it, not to mention getting the site, organizing every-one to pull together, etc., etc.

It's hard to judge which is more important, but it you can significantly cut down on either 1, 2, or 3 then you have a much better chance of getting something in place. The reason there are so many NET/ROM // TheNet nodes out there is because they are EASY to install. There is no building required, they hook to a store bought radio, and VIOLA.... instant node.

If you get an organization together that will build the DSY modems and put the whole thing together in a package where someone can just BUY IT and PLUG IT IN, then they will take off like a rocket and will become the new standard. This is why so many people are interested in the TAPR 9600 Baud packetRADIO. We see it as a 9600 baud unit that we will basically be able to buy off the shelf and plug into the wall and away it will go, plus to our minds it is relatively cheap.... but the important thing is that it is EASY, so it promises to cut down on the TIME, and KNOWLEDGE required.

I think everyone agrees that they would like to have 56KB up and running all over the place. I think everyone agrees that it is proven and is achievable. If I am right, why aren't they up and running all over the country? I think it is because people in general consider them too HARD to go with at this time. They perceive them to take too much KNOWLEDGE and too much TIME. I think if Kantronics sold them completely assembled and guaranteed to work "off the shelf", packaged in a neat little metal box along with plug in radio, then they would sell like hotcakes!

In this area most of the packet network is up and running because of heroic efforts of single individuals. These people value TIME and MONEY above most other things. What is THEORETICALLY best and what SHOULD be done have to be weighed against the TIME//MONEY//KNOWLEDGE equation of the people that are actually going to be required to do it.

I posted this to the net simply because I am sincerely interested in
getting feedback from everyone as to whether I am full of beans or whether
I am hitting the nail on the head and am speaking the true thoughts of a
lot of people in the majority of the country.

I've got the asbestos suit on and am ready and waiting! :-)

Hello again!

Our 56 kbps project is moving on, slooooooowly but steadily. We just
received the necessary information about the WA4DSY modems from GRAPES
- after a couple months serious waiting...

We're going to order the modems pretty soon, and undoubtedly building
them will take a while, too. Anyway, it is now time to give some more
thought to the PC interface.

I suppose there is really no alternative to a regular TNC-2 yet, and
the neat thing is that you can just couple it to a serial connection
of almost any computer. So, we are probably going to settle with that.
I wonder what kind of performance to expect of an AT-compatible
computer? What is the effective speed in file transfer or terminal
usage, respectively? And what kind of response times do you get with
ping, with all the delays added (our plan is to use the Microvawe
Modules transverter)?

The WA4DSY pre-documentation was talking about an EPROM called KISS-56
for the TNC-2. Please give me some information about this! I presume,
that it makes the TNC logic to be "a little bit" more impatient as

when to send its stuff on the air, thus effectively shortening the
packets and the delay in interactive use. Am I correct, and if so, how
much does it speed things up? Anyone tried this?

Also, the ad stated a few TNC's to be fully TNC-2 compatible, and to
accept the KISS-56 firmware. The PK-88 was not mentioned, do you know
if it is compatible? Most of people over here in Finland have a TAPR
TNC-2 clone, which unfortunately has no connection for an external
modem, so we are probably going to have to get a new TNC, too. That
will, of course, add the total cost, and makes the WA4DSY solution
much less attractive.

So, to put it short, information of the KISS-56 firmware is needed.
Thank you in advance!

     73 de Luru

(No chance for a direct reply, my mail bounced. So here goes ...)

If you compare DIGICOM to a TNC you should take a close look to the
release number. Some DC releases are named 4.** but these are patched
versions, because the 'official' newest release is 3.5 and available
since about two weeks. I met Flori, DL8MBT (the originator of DIGICOM)
last saturday and he told me that even the DAMA features are included
in this current release (see the newest proceedings). Plus further
enhancements. An english version of the new user manual is under
translation right now and will be available soon.

When I assembled my Heath HK-232 I noticed the PC board had AEA's
identification on it. No doubt they are of same origin. But Heath
owns the firmware, and thus Heath will determine whether your applications
remain compatible with AES units. I want to know if AES's new PBBS
extension will work on a Heath.

Someon recently advanced the reasons why packet radio is still at the 1200 baud appliance level in the USA. In reverse order, they and my rebuttals are:

>3. Time
     Yup, lots of retired hams haven't got the time to do anything
     in between their morning and afternoon naps. Guess we young
     folks will have to stay up until two in the morning.

>2. Money
     $500 for a 56Kbit modem, transmitter, receiver, and antenna
     must be more than most can afford.

>1. Knowledge
     When you've decided there's nothing more for you to learn,
     you've decided it's time to die.

"I tell you Wilbur, and I tell you Orville, that thing will never fly!"

Seriously, folks, the major reason packet radio is still at 1200bps is because faster stuff isn't available off-the-shelf at Ham Radio Outlet and their ilk. But innovation doesn't require a crowd; history is full of lonely men and women coming up with great things on their own. Why not strike out just a bit on your own and see?

Is this attitude why the USA is becoming a nation of lawyers and clerks, instead of inventors and engineers?

C'mon! We can do it alone, but we can do it SOONER if more than just a few help.

This is probably an OLD question.. I use the Clarkson 3C501 driver with
NET (ala KA9Q). The driver works well except if I try to run the whole mess
in Desqview, my disk interrupt gets clobbered (requests to the hard drive
time out/abort). I have tried loading the Clarkson driver before AND after
starting DV to no avail. NET runs just fine in DV without the Clarkson driver.
I am NOT taking shots at ANY programmers, nor do I wish to be found floating
in a river :-}.. Idea's anyone?? Would VM-386 help/make it worse??

Machine is a 386 using Quarterdeck's Expanded Memory Manager. I believe I
tried it without QEMM too (naked config).

I'm interested in recommendations of sources of information regarding the existing technologies and practices of digital data modulation, hopefully with enough information to be able to design modems like the WA4DSY one.

I'm also interested in what the bits/sec : baud ratios and bandwidths of various systems are.

If the references don't exist in ham publications, then perhaps this can also be taken as a suggestion for someone in the know (more Phil bait :-) to write one.

Thanks, Brian, you said it much better than I could have.

At a bull session during the recent AMSAT convention, one of our European visitors lamented that American hams are much more oriented towards ready-made equipment than Europeans. I think this is true, but it's not necessarily bad. I have a lot of store-bought equipment at my station -- a VHF/UHF satellite setup, an HF station, a commercial TNC, etc. Even my computers were ready-made (well, at least the individual components were -- I did have to plug in the boards).

I generally don't build anything I can buy for a reasonable price. No, I don't consider myself a lazy appliance operator. Why spend time reinventing the wheel when you can be doing something new? (Of course, if you don't know how a wheel works, it doesn't hurt to build one as a learning exercise.) The fact is that my spare time is already fully occupied building those things I CAN'T yet buy ready-made, like 56kb/s modems and networking software packages designed for amateur radio.

Yes, eventually all these things and more will be available off-the-shelf. (I wouldn't mind not having to build any more WA4DSY modems, for example.) But by then they'll just be component building blocks for making even larger systems (like whole networks). And there'll be a whole new set of challenges to face at that level. The list of new things that could be built in ham radio is endless.

But I'll let you in on a secret: the real fun is in the actual *process* of creating, or in learning how somebody else's creation works. If you're not interested in creating nor in learning (both terms broadly construed), then you really *are* just an appliance operator. And I bet you're not having much fun, either.

Mark, I actually happen to agree with you. Perhaps you can lend your voice to mine (which is getting rather hoarse) to encourage GRAPES (and WA4DSY) to license their design to commercial manufacturers, on a non-exclusive basis, so it can be produced in quantity and gain mass acceptance. Production and marketing is the one place where the GRAPES/WA4DSY modem has really fallen down so far. I've been calling this modem "packet radio's best kept secret" for some time.

TAPR's experience has shown repeatedly that a volunteer group is simply not suited for large-scale manufacturing. If the only way to obtain a TNC were still to buy a kit from TAPR (i.e., if TAPR had not widely and nonexclusively licensed its TNC-1 and TNC-2 designs to commercial vendors) then we'd still be back in 1983 or so in terms of the development of the packet network.

On the other hand, if TAPR had developed things a little further before casting them to the winds, perhaps we wouldn't today be saddled with spectral albatrosses like Bell 202 modems which were already obsolete by the time the original TNC came out. I think the TAPR hardware designers worry far too much about cost. They are all too willing to make substantial performance sacrifices just in order to shave a few dollars off the parts cost.

No one, least of all a ham, wants to pay more than they have to for something. But there is also such a thing as false economy -- as when you discover that all the equipment you've been building up piecemeal over the past few years is going to have to be tossed out and replaced because it can't expand or adapt to new operating requirements.

And that's why I push the WA4DSY design so hard -- technically it is clearly superior to the TAPR 9600, yet with a little attention toward mass production details I think the cost differential could be reduced to or near zero. All it needs is a little aggressive attention from some manufacturing engineers.

Ah, yes, that's what you get for snarfing the working updates on flash
without reading the tcp-group mailing list. :-) For the benefit of others
who may have run into this problem, the solution is simple: replace the
backslashes (\) with forward slashes (/).

I made this change quite a few months ago in order to standardize the format
of the ftpusers file across the various ports of NET.

Mailing list? I read comp.protocols.tcp-ip, comp.protocols.tcp-ip.ibmpc
and rec.ham-radio.packet, but didn't know there's a mailing list, too.
Who do I mail to to get on it?

Doug, What can you tell me of the availability right now on DSY modems?
Can I phone order them with a MasterCard?? If so, how?? That is
my favorite way to get INSTANT gratification.. Otherwise, exactly what amount
must I send (incl shipping/hndlg)??
I have an address of: Grapes ,INC.
POB 871
Alpharetta, Ga
30239-0871

Any phone #'s down there?..

Also, in advance can you tell me about the crystalling scheme so I can
get the LONG process of ordering ROCKs out of the way?
I may do a simplex 430-440, duplex 430-440, or duplex 432/905..
Sources for Xverters have all but dried up in QST!!!! Where's the hot place to
 get Microwave Modules stuff? Like what's a phone ##? Do Hamtronics xverters
work well?? I think Brian@UCSD.edu hinted he had Hamtronics xverters in use.
Or, was it Brian Lloyd, RQN type? Major concern with xverters will be getting
the power jacked UP to a good level. What are the most successful people
using for RF POWER amplification? Is the text of the DSY modem manuals
available by FTP on the INTERNET??
Please respond CC: the rec.hamradio-packet forum so others can see too.

Tnx in advance, pat.davis@mail.admin.wisc.edu 128.104.198.10

This is an intriguing idea, but you're right: it is a challenge.
It would be hard to preserve the n+1 rule of grounds (n modules
cascaded require n+1 shields), since you've got gazintas and gozoutas
on both the RF and data side. Still, it should be possible since
the military does it every day (mix RF & micros).

One thing comes to mind right away: NO TTL chips! If you can pull
off this project with MOS & CMOS only, the leisurely rise- and fall-
times should help cut down on broadband noise.

Also, try beforehand to use one master clock at a high frequency
which only has harmonics and subharmonics on either side of your
operating frequency range. This way, if you do have trash you can
pull the oscillator or even dither it.

These two recommendations already preclude the use of 100% of the
existing CPU boards. Feh. I spent a recent evening trying to
determine which of the eight crystal oscillators in my PC was
putting a harmonic on 145.025 -- yuk!

With all these computers showing up at ham stations, we're going
to see a run on 33 uH inductors, ferrite beads, and beryllium-copper
leaf springs soon!

Wish I had read your first, you put it better than I did. But you have
it exactly right, GETTING THERE IS ALL THE FUN.

>   - Brian

Brian puts it fairly clearly but I would like to point out the fundamental difference in an appliance operator and someone who buys ready built equipment. When I bought my string of Icom VHF/UHF gear for satellite work, I got each radio for about $700 at the time. There is no way I could design/build comparable gear. I bought ready made antennas, rotors, and a computer/rotor interface. Am I an appliance operator?

I would say no. At the same time I am doing this, I have developed AEA's follow on to the PK-232, called the DSP-232 (released early next year) and I had a lot to say about the Microsat that will be launched in January. I wrote a satellite tracking program that consistently has been AMSAT's number one fund raiser.

I'm not tooting my horn. I'm trying to make a point and that is it is clear I am not an appliance operator because I am not a ham radio couch potato. IMHO, if you aren't doing SOMETHING, ANYTHING to contribute to the hobby, you are part of the problem we are having. You can contribute in OTHER ways than returning to the almost impossible task of building competitive HF/VHF/UHF all mode transceivers ;-). I think no one expects that of you!

How's about getting off your couch and go find a young girl or boy who can contribute to the future of the hobby and try to interest them. Maybe you can contribute in $ome meaningful way to a 56 KBPS or 9600 BPS or whatever network in your area if you don't have the time or expertise to do it yourself. Ok, I'm off the soap box. I conclude by saying either quit whining about the push to move on and help make it easier or you just turn the rig off as we'll all get hardening of the coax.

Bob

I seem to recall I sent GRAPES a check and had the kit a week or two later - extremely satisfactory service. The thing went together in about two hours and took less than one more to make it work - simple alignment was all it took.

The crystalling scheme is simple: you have a crystal at the transmit frequency and one 10.7 MHz higher for receive injection. For 433.050 MHz (the de-facto 450 channel most people seem to be using), you need one at 29.050 MHz and one at 39.750 MHz.

I ordered my crystals from International Crystal in Oklahoma City and had them about two weeks later. The catalog number for those crystals is 471170. The crystals were just under $10 apiece. ICM's toll-free FAX number is 800-322-9426 and they take credit card orders.

I'm using Hamtronics converters; I have the XV4-2K transmitting converter which gives a nice 2 watts out for $79, and the CA432-2K receiving converter for $49. The receiving converter is kinda numb; you'd want to add a GaAs preamp to that, I'd expect. Hamtronics has such a preamp for $25, but I've not tried it. Hamtronics is in Hilton, New York; their FAX number is 716-392-9420.
